

Strength Training for Young Rugby Players – Position Statement

Introduction

1. This paper provides the RFU position statement on strength (also referred to as “resistance”) training for young players. It outlines the risks of strength training activities via a literature review, attempts to define the various descriptions that are frequently mis-used with reference to strength training and seeks to address some commonly expressed concerns. It was discussed at the Playing Development Sub-Committee on 4th January; Club England on 14th February; Schools & Youth Governance Sub-Committee on 27th March and Governance Committee on 13 April 2007, when it was adopted formally. It was updated in 2012).

Executive Summary

2. Young people are not naturally physically prepared via their normal, everyday lives for the rigour of rugby; strength training may decrease the risk of sports related injuries. In order to be physically prepared to play professional rugby at c.21 (this expectation is getting younger) a player should have started a strength programme in his early teens.
3. Statements from the National Strength and Conditioning Association, the American Orthopaedic Society for Sports Medicine and the American Academy of Paediatrics all indicate major benefits of strength training for children.
4. Strength training may enhance bone development in younger children (Mackelvie et al British Journal of Sports Medicine 36 2002).
5. There is no evidence to suggest that the risk of injury associated with strength training in youth is greater than that associated with other recreational activities in which children and teenagers participate regularly (Jones et al Phys Sports Med 28 2000).
6. The most common causes of injury...are due to lack of supervision (Jones et al Phys Sports Med 28 2000). The RFU elite rugby department has developed strength and conditioning coaching qualifications for sport at levels 1 and 2 and 3 in order to train a suitably qualified workforce – professional and voluntary.
7. Children of any age will respond to strength training, though there will be individual differences in magnitude. Some boys who undergo a strength programme 12 to 18 months after the adolescent growth spurt (average 14.1 years in boys) may exhibit visible hypertrophy due to hormonal changes in the body. The onset of the adolescent growth spurt may vary between individuals by as much as six years, so chronological age is only minimally helpful when comparing players' future potential.
8. Planned strength training programmes should be introduced in the early secondary school years. If this is not done via schools, sports governing bodies and their constituent clubs must lead in this area.
9. The physical status of young rugby players who aspire to play at the elite level should be monitored throughout their careers. In order to do this the RFU elite rugby department has developed the fitness and anthropometric scoring template (FAST) system. This system monitors and provides feedback on a wide range of fitness and anthropometric variables specific to adolescents.

What's the Problem?

10. Professional rugby players are increasingly large and strong. England international forwards and backs in 2011 averaged 113kg and 92kg respectively, compared with 109 kg and 90 kg for their counterparts in 2003, and 100 kg and 83 kg for their counterparts in 1991. A greater proportion of this additional weight in modern players is lean body mass, so more force is generated in the
