**Problem Set 8**

**Reading Rudin, Chapter 8**

Rudin, Chapter 8: 3, 5 (this has many parts!), 12, 15

**Exercise 1** Suppose  $X_1, X_2, \dots$  are independent, identically distributed random variables with  $\mathbf{P}\{X_j = 0\} < 1$ . Let  $S_n = X_1 + \dots + X_n$  and  $N$  a positive integer. Let

$$T = \min\{n : |S_n| \geq N\}.$$

Show that there exist positive numbers  $c, a$  such that for all  $n$ ,

$$\mathbf{P}\{T \geq n\} \leq ce^{-an}.$$

Conclude that  $\mathbf{E}[T] < \infty$ .

**Exercise 2** Prove Jensen's inequality for conditional expectation: suppose  $f : \mathbb{R} \rightarrow \mathbb{R}$  is convex and  $X$  is an integrable random variable such that  $f(X)$  is also integrable. Then

$$\mathcal{E}[f(X) \mid \mathcal{G}] \geq f(\mathcal{E}[X \mid \mathcal{G}]).$$

(Hint: One approach starts as follows. Show that for any convex  $f$  there is a countable collection of real numbers  $\alpha_j, \beta_j$  such that

$$f(x) = \sup[\alpha_j x + \beta_j]. \quad )$$

**Exercise 3** Suppose there is an urn which at time  $n = 0$  has one red and one green ball. At each integer time  $n$  the balls in the urn are mixed and one ball is chosen at random. The color of that ball is noted and then it and another ball of the same color are put back in the urn. Let  $W_n$  denote the number of red balls at time  $n$ . The total number of balls at time  $n$  is  $n + 2$  and hence the number of green balls is  $(n + 2) - W_n$ . Let

$$M_n = \frac{W_n}{n + 2}$$

denote the fraction of red balls at time  $n$ .

1. Show that  $M_n$  is a martingale.
2. Show that for each  $n$ ,  $M_n$  is uniformly distributed over the set

$$\frac{1}{n+2}, \frac{2}{n+2}, \dots, \frac{n+1}{n+2}.$$

3. Suppose  $M_n = a < b \leq 1$  for some  $n$  and let  $T$  be the first time  $m > n$  that  $M_m \geq b$ . Show that

$$\mathbf{P}\{T < \infty \mid M_n = a\} \leq \frac{a}{b}.$$

4. Show that there is a random variable  $M_\infty$  such that with probability one

$$\lim_{n \rightarrow \infty} M_n = M_\infty.$$

5. What is the distribution of  $M_\infty$ ?

Numerical Methods for Linear Control Systems Design and Analysis is an interdisciplinary textbook aimed at systematic descriptions and implementations of numerically viable algorithms based on well established efficient and stable modern numerical linear techniques for mathematical problems arising in the design and analysis of linear control systems both for the first and second order models Unique coverage of modern mathematical concepts such as parallel computations second

order systems and large scale solutions Background material in linear algebra numerical linear algebra and control theory included in text Step by step explanations of the algorithms and examples      *System Identification and Adaptive Control* Yiannis Boutalis,Dimitrios Theodoridis,Theodore Kottas,Manolis A. Christodoulou,2014-04-23 Presenting current trends in the development and applications of intelligent systems in engineering this monograph focuses on recent research results in system identification and control The recurrent neurofuzzy and the fuzzy cognitive network FCN models are presented Both models are suitable for partially known or unknown complex time varying systems Neurofuzzy Adaptive Control contains rigorous proofs of its statements which result in concrete conclusions for the selection of the design parameters of the algorithms presented The neurofuzzy model combines concepts from fuzzy systems and recurrent high order neural networks to produce powerful system approximations that are used for adaptive control The FCN model stems from fuzzy cognitive maps and uses the notion of concepts and their causal relationships to capture the behavior of complex systems The book shows how with the benefit of proper training algorithms these models are potent system emulators suitable for use in engineering systems All chapters are supported by illustrative simulation experiments while separate chapters are devoted to the potential industrial applications of each model including projects in contemporary power generation process control and conventional benchmarking problems Researchers and graduate students working in adaptive estimation and intelligent control will find Neurofuzzy Adaptive Control of interest both for the currency of its models and because it demonstrates their relevance for real systems The monograph also shows industrial engineers how to test intelligent adaptive control easily using proven theoretical results      **Regularity Techniques for Elliptic PDEs and the Fractional Laplacian** Pablo Raúl Stinga,2024-07-02 Regularity Techniques for Elliptic PDEs and the Fractional Laplacian presents important analytic and geometric techniques to prove regularity estimates for solutions to second order elliptic equations both in divergence and nondivergence form and to nonlocal equations driven by the fractional Laplacian The emphasis is placed on ideas and the development of intuition while at the same time being completely rigorous The reader should keep in mind that this text is about how analysis can be applied to regularity estimates Many methods are nonlinear in nature but the focus is on linear equations without lower order terms thus avoiding bulky computations The philosophy underpinning the book is that ideas must be flushed out in the cleanest and simplest ways showing all the details and always maintaining rigor Features Self contained treatment of the topic Bridges the gap between upper undergraduate textbooks and advanced monographs to offer a useful accessible reference for students and researchers Replete with useful references      Operator Theory and Ill-Posed Problems Mikhail M. Lavrent'ev,Lev Ja. Savel'ev,2011-12-22 This book consists of three major parts The first two parts deal with general mathematical concepts and certain areas of operator theory The third part is devoted to ill posed problems It can be read independently of the first two parts and presents a good example of applying the methods of calculus and functional analysis The first part Basic Concepts briefly introduces the language of set theory and concepts of abstract linear

and multilinear algebra Also introduced are the language of topology and fundamental concepts of calculus the limit the differential and the integral A special section is devoted to analysis on manifolds The second part Operators describes the most important function spaces and operator classes for both linear and nonlinear operators Different kinds of generalized functions and their transformations are considered Elements of the theory of linear operators are presented Spectral theory is given a special focus The third part Ill Posed Problems is devoted to problems of mathematical physics integral and operator equations evolution equations and problems of integral geometry It also deals with problems of analytic continuation Detailed coverage of the subjects and numerous examples and exercises make it possible to use the book as a textbook on some areas of calculus and functional analysis It can also be used as a reference textbook because of the extensive scope and detailed references with comments

**Modern Methods of Polymer Characterization** Howard G. Barth, Jimmy W. Mays, 1991-09-03 Presents the methods used for characterization of polymers In addition to theory and basic principles the instrumentation and apparatus necessary for methods used to study the kinetic and thermodynamic interactions of a polymer with its environment are covered in detail Some of the methods examined include polymer separations and characterization by size exclusion and high performance chromatography inverse gas chromatography osmometry viscometry ultracentrifugation light scattering and spectroscopy

*Automatic Sequences* Jean-Paul Allouche, Jeffrey Shallit, 2003-07-21 Uniting dozens of seemingly disparate results from different fields this book combines concepts from mathematics and computer science to present the first integrated treatment of sequences generated by finite automata The authors apply the theory to the study of automatic sequences and their generalizations such as Sturmian words and  $k$  regular sequences And further they provide applications to number theory particularly to formal power series and transcendence in finite characteristic physics computer graphics and music Starting from first principles wherever feasible basic results from combinatorics on words numeration systems and models of computation are discussed Thus this book is suitable for graduate students or advanced undergraduates as well as for mature researchers wishing to know more about this fascinating subject Results are presented from first principles wherever feasible and the book is supplemented by a collection of 460 exercises 85 open problems and over 1600 citations to the literature

**The Dynamics of Physiologically Structured Populations** Johan A. Metz, Odo Diekmann, 2014-03-11

[A First Course in Functional Analysis](#) Orr Moshe Shalit, 2017-03-16 Written as a textbook A First Course in Functional Analysis is an introduction to basic functional analysis and operator theory with an emphasis on Hilbert space methods The aim of this book is to introduce the basic notions of functional analysis and operator theory without requiring the student to have taken a course in measure theory as a prerequisite It is written and structured the way a course would be designed with an emphasis on clarity and logical development alongside real applications in analysis The background required for a student taking this course is minimal basic linear algebra calculus up to Riemann integration and some acquaintance with topological and metric spaces

*Fourier Series* R.E. Edwards, 2012-12-06 The principal aim in writing this book has been to provide an introduction barely more to some aspects of Fourier series and related topics in which a liberal use is made of modern techniques and which guides the reader toward some of the problems of current interest in harmonic analysis generally The use of modern concepts and techniques is in fact as wide spread as is deemed to be compatible with the desire that the book shall be useful to senior undergraduates and beginning graduate students for whom it may perhaps serve as preparation for Rudin's Harmonic Analysis on Groups and the promised second volume of Hewitt and Ross's Abstract Harmonic Analysis The emphasis on modern techniques and outlook has affected not only the type of arguments favored but also to a considerable extent the choice of material Above all it has led to a minimal treatment of pointwise convergence and summability as is argued in Chapter 1 Fourier series are not necessarily seen in their best or most natural role through pointwise tinted spectacles Moreover the famous treatises by Zygmund and by Baryon trigonometric series cover these aspects in great detail while leaving some gaps in the presentation of the modern viewpoint the same is true of the more elementary account given by Tolstov Likewise and again for reasons discussed in Chapter 1 trigonometric series in general form no part of the program attempted
