**Krishnamurthy, Dr. Natarajan**

### **ABSTRACT**

When a structure fails, there is invariably an investigation to find out why it failed. Apart from the legal and professional necessity to determine the cause of failure, there is also the need to learn from it lessons that would enable subsequent designers and builders or fabricators to avoid the pitfalls of the failed structure and develop safer alternatives.

Technological developments in recent decades have introduced new configurations, materials and methods of design and construction that raise new and complex problems. Failures are caused by many unprecedented causes singly or in combination. Paradoxically, in this pursuit of novelty and innovation, even basic principles of sound structural design and good construction practice are often violated, leading to failures.

Author has more than five decades of teaching, research, and consulting experience in structural engineering, computer applications, and recently, in construction safety, failure investigation, and risk management, in USA, Singapore, and India. During his professional service, he has had many opportunities to study structural and construction failures, discuss with other professionals, collaborate with forensic experts, and also report and testify on failure investigations.

This paper will review the scope of forensic engineering in the light of the increased need for increased attention to and proper documentation of the design/construction process; discuss the preparation required for failure investigation; point out critical procedures and protocols in the actual investigation; and illustrate its application by a few classical case studies from around the world, and a few from his own experience.
