

**Q1) Find the Future value and compound interest on an investment of 700 \$ compounded quarterly at 10 % for 3 years.**

**Solution:**

$$FV=S=P(1+r)^N$$

Since  $P=700$  \$ ,  $N=n*T=3*4=12$  ,  $r=R/n=0.1/4=0.025$   
 $FV=S=P(1+r)^N=700(1+0.025)^{12}=700*1.34489=941.42$  \$

compound interest= $I=FV-P=941.42-700=241.42$  \$.

**Q2) Mr X deposited 4000 \$ in a saving account paying 2 % interest compounded daily. Find Future value of the money and compound interest he earned at the end of 5 years.**

**Solution:**

$$FV=S=P(1+r)^N$$

Since  $P=4000$  \$ ,  $N=n*T=5*365=1825$  ,  
 $r=R/n=0.02/365=0.025=5.48*10^{-5}$   
 $FV=S=P(1+r)^N=4000(1+5.48*10^{-5})^{1825}=4000*1.10517=4420.67$  \$  
 compound interest= $I=FV-P=4420.67-4000=420.67$  \$.

What principle will amount to \$3000 if invested at 6.5% compounded weekly for 4 years?

$A = 3000, r = 0.065, n = 52, t = 4$  Identify each variable

$$3000 = P \left( 1 + \frac{0.065}{52} \right)^{52 \cdot 4}$$
 Evaluate parentheses

$$3000 = P(1.00125)^{208}$$
 Multiply exponent

$$3000 = P(1.00125)^{208}$$
 Evaluate exponent

$$3000 = P(1.296719528...)$$
 Divide each side by 1.296719528...

$$\frac{3000}{1.296719528...} = \frac{P}{1.296719528...}$$

$$2313.53 = P$$
 Solution for  $P$

*Novel Methods in Computational Finance* Matthias Ehrhardt, Michael Günther, E. Jan W. ter Maten, 2017-09-19 This book discusses the state of the art and open problems in computational finance. It presents a collection of research outcomes and reviews of the work from the STRIKE project, an FP7 Marie Curie Initial Training Network (ITN) project in which academic partners trained early stage researchers in close cooperation with a broader range of associated partners including from the private sector. The aim of the project was to arrive at a deeper understanding of complex, mostly nonlinear financial models and to develop effective and robust numerical schemes for solving linear and nonlinear problems arising from the mathematical theory of pricing financial derivatives and related financial products. This was accomplished by means of financial modelling, mathematical analysis and numerical simulations, optimal control techniques and validation of models. In recent years, the computational complexity of mathematical models employed in financial mathematics has witnessed tremendous growth. Advanced numerical techniques are now essential to the majority of present day applications in the financial industry. Special attention is devoted to a uniform methodology for both testing the latest achievements and simultaneously educating young PhD students. Most of the mathematical codes are linked into a novel computational finance toolbox which is provided in MATLAB and PYTHON with an open access license. The book offers a valuable guide for researchers in computational finance and related areas, e.g. energy markets with an interest in industrial mathematics.

**Stochastic Linear-Quadratic Optimal Control Theory: Open-Loop and Closed-Loop Solutions** Jingrui

Sun, Jiongmin Yong, 2020-06-29 This book gathers the most essential results including recent ones on linear quadratic optimal control problems which represent an important aspect of stochastic control. It presents the results in the context of finite and infinite horizon problems and discusses a number of new and interesting issues. Further, it precisely identifies for the first time the interconnections between three well-known relevant issues: the existence of optimal controls, solvability of the optimality system and solvability of the associated Riccati equation. Although the content is largely self-contained, readers should have a basic grasp of linear algebra, functional analysis and stochastic ordinary differential equations. The book is mainly intended for senior undergraduate and graduate students majoring in applied mathematics who are interested in stochastic control theory. However, it will also appeal to researchers in other related areas such as engineering, management, finance, economics and the social sciences.
