Untersuchung der Flugeigenschaften von Flugzeugen anhand der Phygoidbewegung Michael Götting, 2004-12-01 Inhaltsangabe Zusammenfassung Ein Flugzeug benigt zufrieden stellende Flugeigenschaften sowie Flugeigenschaften Bei der Betrachtung der Flugeigenschaften befasst man sich mit Fragestellungen zur Stabilität und Steuerbarkeit des Flugzeugs Um die Belastung des Piloten so weit wie möglich zu reduzieren muss das Flugzeug eine angemessene Stabilität besitzen Das heißt wenn ein Flugzeug durch eine Störung aus seinem Gleichgewichtszustand gebracht wird sollte es die Tendenz haben wieder ins Gleichgewicht zurückzukehren ohne dass der Pilot einen großen Teil seiner Aufmerksamkeit der Stabilisierung widmen muss Ein besonderes Interesse gilt dabei dem Schwingungsverhalten des Flugzeugs Hier unterscheidet man langperiodische Schwingungsbewegungen wie die Phygoidbewegung und hochfrequente Bewegungen wie die Anstellwinkelschwingung Die Phygoid tritt bei jedem Flugzeug auf und soll deshalb im Rahmen dieser Arbeit detailliert untersucht werden Die Untersuchung umfasst zunächst den physikalischen bzw flugmechanischen Hintergrund und die mathematische Beschreibung der Bewegung Kapitel 2 7 Zur Berechnung und Darstellung wird ein MATLAB Modell erstellt dessen Ergebnisse zunächst mit den Resultaten eines praktischen Flugversuchs verglichen werden Kapitel 8 9 Danach wird mithilfe des Modells der Einfluss des Flugzustandes auf die Phygoid anhand zweier Beispielflugzeuge untersucht Kapitel 10 Dazu werden verschiedene wichtige Parameter variiert Im Folgenden wird dann ebenfalls unter Anwendung des entwickelten MATLAB Modells die Phygoidbewegung verschiedener Passagierflugzeuge in speziellen Flugphasen untersucht Kapitel 11 und bezüglich ihrer Flugeigenschaften bewertet Im Anschluss werden die Handhabung des Schwingungsverhaltens beim Flugzeugentwurf und die Möglichkeit der Beeinflussung durch Flugregler beschrieben Kapitel 12 Die detaillierte Untersuchung der Phygoidbewegung im allgemeinen und im Speziellen für verschiedene Flugzeuge und Parametereinflüsse sowie im modernen Flugzeugentwurf stellt das Ziel dieser Arbeit dar

Fighter Aircraft Maneuver Limiting Using MPC: Theory and Application Daniel Simon, 2017-09-12 Flight control design for modern fighter aircraft is a challenging task Aircraft are dynamical systems which naturally contain a variety of constraints and nonlinearities such as e g maximum permissible load factor angle of attack and control surface deflections Taking these limitations into account in the design of control systems is becoming increasingly important as the performance and complexity of the aircraft is constantly increasing The aeronautical industry has traditionally applied feedforward anti windup or similar techniques and different ad hoc engineering solutions to handle constraints on the aircraft However these approaches often rely on engineering experience and insight rather than a theoretical foundation and can often require a tremendous amount of time to tune In this thesis we investigate model predictive control as an alternative design tool to

handle the constraints that arises in the flight control design We derive a simple reference tracking MPC algorithm for linear systems that build on the dual mode formulation with guaranteed stability and low complexity suitable for implementation in real time safety critical systems To reduce the computational burden of nonlinear model predictive control we propose a method to handle the nonlinear constraints using a set of dynamically generated local inner polytopic approximations The main benefit of the proposed method is that while computationally cheap it still can guarantee recursive feasibility and convergence An alternative to deriving MPC algorithms with guaranteed stability properties is to analyze the closed loop stability post design Here we focus on deriving a tool based on Mixed Integer Linear Programming for analysis of the closed loop stability and robust stability of linear systems controlled with MPC controllers To test the performance of model predictive control for a real world example we design and implement a standard MPC controller in the development simulator for the JAS 39 Gripen aircraft at Saab Aeronautics This part of the thesis focuses on practical and tuning aspects of designing MPC controllers for fighter aircraft Finally we have compared the MPC design with an alternative approach to maneuver limiting using a command governor

Addington, 2000 A static wind tunnel test of the Innovative Controls Effectors ICE 101 conceptual aircraft configuration was conducted in the Air Force Research Laboratory s Vertical Wind Tunnel This entry characterized the

increments to the aerodynamic loading provided by the various control surfaces while using a more finely resolved test matrix in angle of attack and sideslip than typically seen in wind tunnel testing The purpose for obtaining these data was to determine the effect which control surface deflection had on critical state locations in preparation for the test of a second ICE model built with remotely actuated control surfaces Critical states are discrete flight mechanical states where the aerodynamic response loses its analytic dependence on one or more state variables These data demonstrate that the aerodynamic increments are in many cases at minimum nonlinear functions of the surface deflection angle and strongly suggest that some critical states do shift in angle of attack and or sideslip with changing deflection angle
