Showalter, 2012-12-06 The concept of macroscopic waves and patterns developing from chemical reaction coupling with diffusion was presented apparently for the first time at the Main Meeting of the Deutsche Bunsengesellschaft für Angewandte Physikalische Chemie held in Dresden Germany from May 21 to 24 1906 Robert Luther Director of the Physical Chemistry Laboratory in Leipzig read his paper on the discovery and analysis of propagating reaction diffusion fronts in autocatalytic chemical reactions 1 2 He presented an equation for the velocity of these new waves  $V = \frac{1}{2} \sqrt{Dk}$  and asserted that they might have features in common with propagating action potentials in nerve cell axons During the discussion period a skeptic in the audience voiced his objections to this notion It was none other than the great physical chemist Walther Nernst who believed that nerve impulse propagation was far too rapid to be akin to the propagating fronts He was also not willing to accept Luther's wave velocity equation without a derivation Luther stood his ground saying his equation was a simple consequence of the corresponding differential equation He described several different autocatalytic reactions that exhibit propagating fronts recommending gelling the solution to prevent convection and even presented a demonstration the autocatalytic permanganate oxidation of oxalate was carried out in a test tube with the image of the front projected onto a screen for the audience      **Newtonian Dynamics** Richard Fitzpatrick, 2021-12-24 This textbook provides a comprehensive review of Newtonian dynamics at a level suitable for undergraduate physics students It demonstrates that Newton's three laws of motion combined with a few simple force laws not only can describe the motions of everyday objects observed on the surface of the Earth but can also account for the motions of celestial objects seen in the sky It helps bridge the problematic transition between elementary physics courses and upper division physics courses The book starts off at a level suitable for

undergraduate freshman physics students and very gradually increases until toward the end it approaches but does not quite reach a level characteristic of a graduate senior physics course Each chapter of the book ends with a large number of numerical and analytical exercises and in all appropriate cases the final answers to the exercises are specified The large number of exercises will allow students to accurately test their understanding of the material presented in the book ideal for students who are self studying or are taking classes remotely Key Features Provides a brief and accessible introduction to a complex topic Contains a more thorough treatment of the motions of heavenly bodies than conventional elementary mechanics texts Provides a wealth of end of chapter exercises to test understanding Richard Fitzpatrick is a Professor of physics at the University of Texas at Austin USA where he has been a faculty member since 1994 He is a member of the Royal Astronomical Society a fellow of the American Physical Society and the author of several textbooks
