

THE CELL

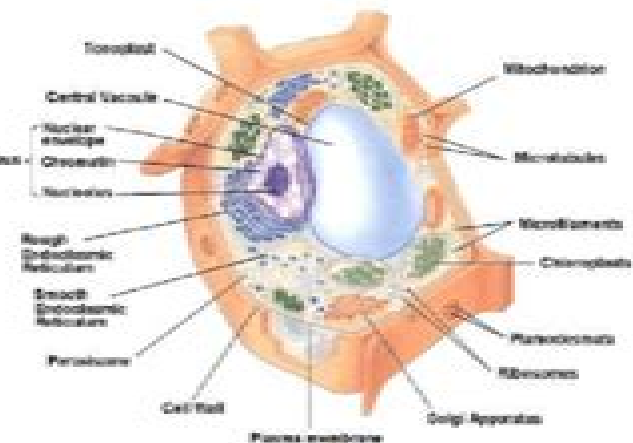

CELL THEORY

The scientific study of cells- their structures, functions, and activities is called **cytology**. The *cell is the smallest unit of life*. In 1590, **Francis and Zacharias Janssen** constructed the first compound microscope. The cell as a structural unit was first observed by **Robert Hooke** in 1665 in thin slices of cork and other plant tissues. At about the same time (1674) the Dutch lensmaker **Leeuwenhoek** reported seeing "animalcules" or single-celled organisms through his microscope. **Marcello Malpighi** used a microscope to examine and describe thin slices of animal tissues from brain, liver, kidney, spleen, lungs, and tongue. In time, the quality of microscopes improved. Thus in the early 1800 the concept of the cell theory began to gain currency in scientific world. **Theodor Schwann** (a zoologist) wove the various loose ends into a coherent theory which proposed that *all organisms are composed of cells and the product of cells*. In 1831, **Robert Brown** described and named the nucleus of the cell. At the end of the decade **Purkinje** proposed using the term protoplasm to describe the living material within the cell. **Thomas Huxley** later called protoplasm the "physical basis of life". Another advancement came about when **Rudolf Virchow** stated an important principle: *All cells arise from pre-existing cells*. That there is no spontaneous creation of cells from non-living matter was supported by the experiment conducted by **Louis Pasteur**. This marked the end of a belief in spontaneous generation theory and the establishment of the principle of biogenesis.
