Fundamentals Of Fractured Reservoir Engineering:

Fundamentals of Fractured Reservoir Engineering T.D. van Golf-Racht, 1982-04-01 In the modern language of reservoir engineering by reservoir description is understood the totality of basic local information concerning the reservoir rock and fluids which by various procedures are extrapolated over the entire reservoir Fracture detection evaluation and processing is another essential step in the process of fractured reservoir description In chapter 2 all parameters related to fracture density and fracture intensity together with various procedures of data processing are discussed in detail After a number of field examples developed in Chap 3 the main objective remains the quantitative evaluation of physical properties This is done in Chap 4 where the evaluation of fractures porosity and permeability their correlation and the equivalent ideal geometrical models versus those parameters are discussed in great detail Special rock properties such as capillary pressure and relative permeability are reexamined in the light of a double porosity reservoir rock In order to complete the results obtained by direct measurements on rock samples Chap 5 examines fracturing through indirect measurements from various logging results The entire material contained in these five chapters defines the basic physical parameters and indicates procedures for their evaluation which may be used further in the description of fractured reservoirs

Well Test Analysis for Fractured Reservoir Evaluation G. Da Prat, 1990-11-19 The main purpose of this book is to provide the reader with a basic understanding of the behaviour of fractured reservoirs using evaluation techniques based on processing pressure and flow rate data resulting from production testing It covers the fundamental reservoir engineering principles involved in the analysis of fluid flow through fractured reservoirs the application of existing models to field cases and the evaluation and description of reservoirs based on processed data from pressure and production tests The author also discusses production decline analysis the understanding of which is a key factor influencing completion or abandonment of a well or even a field The theoretical concepts are presented as clearly and simply as possible in order to aid comprehension The book is thus suitable for training and educational purposes and will help the reader who is unfamiliar with the subject acquire the necessary skills for successful interpretation and analysis of field data One of the most important features of the book is that it fills the gap between field operations and research in regard to proper management of reservoirs The book also contains a computer program FORTRAN language which can be incorporated in existing software designed for reservoir evaluation type curves generation test design and interpretation can be achieved by using this program Petroleum engineers reservoir engineers petroleum geologists research engineers and students in these fields will be interested in this book as a reference source It can also be used as a text book for training production and reservoir engineering professionals It should

Hydrocarbon Seals P. Møller-Pedersen, A.G. Koestler, 1997-12-18 In January 1996 a total of 270 conference participants gathered for 3 days in Trondheim Norway to focus on and to discuss the complex topic of hydrocarbon seals particularly related to deformation zones and to caprocks The conference was the first in Norway and one of the first in Europe to exclusively address this very important subject The purpose of the conference was to present some of the most recent research results to establish state of the art with respect to understanding hydrocarbon seals and to discuss where to go from here to find some of the keys to successful future exploration and enhanced oil and gas recovery Out of the presented papers and posters 17 are compiled and published in this volume These provide a good overview of and an introduction to the numerous aspects covered during the fruitful days in Trondheim

Fractures and Fracture Networks P.M. Adler, J.-F. Thovert, 2013-03-09 Both the beauty and interest of fractures and fracture networks are easy to grasp since they are abundant in nature An example is the road from Digne to Nice in the south of France with an impressive number and variety of such structures the road for the most part goes through narrow valleys with fast running streams penetrating the rock faces erosion is favored by the Mediterranean climate so that rocks are barely covered by meager vegetation In this inhospitable and sterile landscape the visitor can immediately discover innumerable fractures in great masses which have been distorted by slow yet powerful movements This phenomenon can be seen for about 100 kilometers all kinds of shapes and combinations are represented and can be observed either in the mountain itself or in the man made cliffs and excavations resulting from improvements made to the road In the same region close to the Turini Pass a real large scale hydrodynamic experiment is taking place a source which is situated on the flank on the mountain has been equipped with a tap if the tap is open water flows through the tap only but when it is closed then the side of the mountain releases water in a matter of seconds Other outlets are also influenced by this tap such as a water basin situated a few hundred meters away

Rock Testing and Site Characterization J.A. Hudson, 2014-06-16 Rock Testing and Site Characterization

Carbonate Reservoir Rocks Ksenia I. Bagrintseva, 2015-07-29 Most of the world's energy still comes from fossil fuels and there are still many strides being made in the efficiency and cost effectiveness of extracting these important and increasingly more elusive natural resources This is only possible if the nature of the emergence evolution and parameter estimation of high grade reservoir rocks at great depths is known and a theory of their forecast is developed Over 60 percent of world oil production is currently associated with carbonate reservoir rocks The exploration appraisal and development of these fields are significantly complicated by a number of factors These factors include the structural complexity of the carbonate complexes variability of the reservoir rock types and properties within a particular deposit many

unknowns in the evaluation of fracturing and its spatial variability and the preservation of the reservoir rock qualities with depth. The main objective of most studies is discovering patterns in the reservoir rock property changes of carbonate deposits of different genesis, composition and age. A short list of the unsolved issues includes the role of facies environment in the carbonate formation, the major geologic factors affecting the formation of high capacity reservoir rocks and preservation of their properties, recommendations as to the use of the new techniques in studies of the structural parameters and establishing a correlation between the major evaluation parameters. The focus of this volume is to show the scientific and engineering community a revolutionary process. The author perfected an earlier developed methodology in studies of the void space structure. Bagrintseva's method (1982). This methodology is based on carbonate rock saturation with luminophore and on special techniques in processing of photographs made under UV light. The luminophore technique was combined with the raster electron microscopy and its variation, the studies under the cathode luminescence regime. This combination enabled a more detailed study of the reservoir void space, the nonuniformity in the open fracture evolution, their morphology, length and variability of openness. Over recent years, these techniques have found wide application. Useful for the veteran engineer or scientist and the student alike, this book is a must have for any geologist, engineer or student working in the field of upstream petroleum engineering.
