Cognitive Neuroscience of Language David Kemmerer, 2014-11-20. Language is one of our most precious and uniquely human capacities so it is not surprising that research on its neural substrates has been advancing quite rapidly in recent years. Until now however there has not been a single introductory textbook that focuses specifically on this topic. Cognitive Neuroscience of Language fills that gap by providing an up to date wide ranging and pedagogically practical survey of the most important developments in the field. It guides students through all of the major areas of investigation beginning with fundamental aspects of brain structure and function and then proceeding to cover aphasia syndromes, the perception and production of speech, the processing of language in written and signed modalities, the meanings of words and the formulation and comprehension of complex expressions including grammatically inflected words, complete sentences and entire stories. Drawing heavily on prominent theoretical models, the core chapters illustrate how such frameworks are supported and sometimes challenged by experiments employing diverse brain mapping techniques. Although much of the content is inherently challenging and intended primarily for graduate or upper level undergraduate students, it requires no previous knowledge of either neuroscience or linguistics, defining technical terms and explaining important principles from both disciplines along the way.

The Oxford Handbook of Cognitive Literary Studies Lisa Zunshine, 2015. The Oxford Handbook of Cognitive Literary Studies applies developments in cognitive science to a wide range of literary texts that span multiple historical periods and numerous national literary traditions.

Neuroscience in Information Systems Research René Riedl, Fred D. Davis, Rajiv Banker, Peter H. Kenning, 2017-01-25. This book shows how information systems (IS) scholars can effectively apply neuroscience expertise in ways that do not require neuroscience tools. However, the approach described here is intended to complement neuroscience tools, not to supplant them. Written by leading scholars in the field, it presents a review of the empirical literature on NeuroIS and provides a conceptual description of basic brain function from a cognitive neuroscience perspective. Drawing upon the cognitive neuroscience knowledge developed in non-IS contexts, the book enables IS scholars to reinterpret existing behavioral findings, develop new hypotheses, and eventually test the hypotheses with non neuroscience tools. At its core, the book conveys how neuroscience knowledge makes a deeper understanding of IS phenomena possible by connecting the behavioral and neural levels of analysis.

Proust Was a Neuroscientist Jonah Lehrer, 2008-09-01. The New York Times bestselling author provides an entertaining look at how artists enlighten us about the workings of the brain. New York magazine. In this book, the author of *How We Decide* and *Imagine How Creativity Works* writes skillfully and coherently about both art and science and about the connections between the two. Entertainment Weekly. In this technology driven age, it's tempting to believe that science can solve every mystery. After all, it's cured countless diseases and sent humans into space. But as Jonah Lehrer explains, science is not the only path to

knowledge In fact when it comes to understanding the brain art got there first Taking a group of artists a painter a poet a chef a composer and a handful of novelists Lehrer shows how each one discovered an essential truth about the mind that science is only now rediscovering We learn for example how Proust first revealed the fallibility of memory how George Eliot discovered the brain's malleability how the French chef Escoffier discovered umami the fifth taste how C zanne worked out the subtleties of vision and how Gertrude Stein exposed the deep structure of language a full half century before the work of Noam Chomsky and other linguists More broadly Lehrer shows that there's a cost to reducing everything to atoms and acronyms and genes Measurement is not the same as understanding and art knows this better than science does An ingenious blend of biography criticism and first rate science writing Proust Was a Neuroscientist urges science and art to listen more closely to each other for willing minds can combine the best of both to brilliant effect His book marks the arrival of an important new thinker Wise and fresh Los Angeles Times

Providing a new conceptual scaffold for further research in biology and cognition this book introduces the new field of Cognitive Biology a systems biology approach showing that further progress in this field will depend on a deep recognition of developmental processes as well as on the consideration of the developed organism as an agent able to modify and control its surrounding environment The role of cognition the means through which the organism is able to cope with its environment cannot be underestimated In particular it is shown that this activity is grounded on a theory of information based on Bayesian probabilities The organism is considered as a cybernetic system able to integrate a processor as a source of variety the genetic system a regulator of its own homeostasis the metabolic system and a selecting system separating the self from the non self the membrane in unicellular organisms Any organism is a complex system that can survive only if it is able to maintain its internal order against the spontaneous tendency towards disruption Therefore it is forced to monitor and control its environment and so to establish feedback circuits resulting in co adaptation Cognitive and biological processes are shown to be inseparable *Developmental Science* Marc H. Neuropsychology of the Sense of Agency Michela Balconi, 2010-09-08 Not nothing without you but not the same Erich Fried 1979 How do I know that I am the person who is moving The neuroscience of action has identified specific cognitive processes that allow the organism to refer the cause or origin of an action to its agent This sense of agency has been defined as the sense that I am the one who is causing or generating an action or a certain thought in my stream of consciousness As such one can distinguish actions that are self generated from those generated by others giving rise to the experience of a self other distinction in the domain of action A tentative list of the features distinguishing the concept of agency includes awareness of a goal of an intention to act and of initiation of action awareness of movements a sense of activity of mental effort and of control and the concept of authorship However it remains unclear how these various aspects of action and agency are related to what extent they are dissociable and whether some are more basic than others Their sources remain to be specified and their relationship to action specification and action control mechanism is as yet unknown
