4.2 User Requirements

[Provide requirements of the system, user or business, to classes/categories of users. Provide the type of user characteristics of each set of users. List the functional req user requirement. As the functional requirements are de functional requirements are traced to the user requirement functional requirements is not mandatory in the traceability parent requirements are already traced to them.

User requirement information can be in text or process flow class that shows what inputs will initiate the system functionality.

what outputs are expected to be generated by the system. The scenarios should be comprehensive, to the extent that all user types and all major functions are covered. Give each user requirement a unique number. Typically, user requirements have a numbering system that is separate from the functional requirements. Requirements may be labeled with a leading "U" or other label indicating user requirements.]

4.3 Data Flow Diagrams

[Decompose the context level diagrams to determine the functional requirements. Data flow diagrams should be decomposed down to the functional primitive level. These diagrams are further decomposed during design.]

4.4 Logical Data Model/Data Dictionary

[Create the initial Logical Data Model. Describe data requirements by providing data entities, decomposition, and definitions in a data dictionary. The data requirements describe the business data needed by the application system. Data requirements do not describe the physical database and are not at the level of identifying field names.]

Analysis and Design of Next-Generation Software Architectures Arthur M. Langer,2020-01-02 This book provides a detailed how to guide addressing aspects ranging from analysis and design to the implementation of applications which need to be integrated within legacy applications and databases The analysis and design of the next generation of software architectures must address the new requirements to accommodate the Internet of things IoT cybersecurity blockchain networks cloud and quantum computer technologies As 5G wireless increasingly establishes itself over the next few years moving legacy applications into these new architectures will be critical for companies to compete in a consumer driven and social media based economy Few organizations however understand the challenges and complexities of moving from a central database

legacy architecture to a ledger and networked environment The challenge is not limited to just designing new software applications Indeed the next generation needs to function more independently on various devices and on more diverse and wireless centric networks Furthermore databases must be broken down into linked list based blockchain architectures which will involve analytic decisions regarding which portions of data and metadata will be processed within the chain and which ones will be dependent on cloud systems Finally the collection of all data throughout these vast networks will need to be aggregated and used for predictive analysis across a variety of competitive business applications in a secured environment Certainly not an easy task for any analyst designer Many organizations will continue to use packaged products and open source applications These third party products will need to be integrated into the new architecture paradigms and have seamless data aggregation capabilities while maintaining the necessary cyber compliances The book also clearly defines the roles and responsibilities of the stakeholders involved including the IT departments users executive sponsors and third party vendors The book s structure also provides a step by step method to help ensure a higher rate of success in the context of re engineering existing applications and databases as well as selecting third party products conversion methods and cybercontrols It was written for use by a broad audience including IT developers software engineers application vendors business line managers and executives
