Genomic characterization of animal genetic resources Food and Agriculture Organization of the United Nations, Ajmone-Marsan, P, Boettcher, P. J., Ginja, C., Kantanen J., Lenstra, J.A, 2023-01-12 Molecular biotechnologies have developed rapidly and substantially since the release of these previous guidelines The livestock sector has been an active participant in the so called genomic revolution Advancements in the sequencing of genomes and related genotyping methods have created opportunities for gathering much more information on the molecular level than ever possible at a faster rate and for exponentially decreased costs Scientists and other livestock stakeholders in countries with highly developed economies have been among the main beneficiaries of this revolution However the greatly decreased costs of genomic applications have also created opportunities in countries with developing and transitional economies In many instances the lack of awareness of these opportunities and in the technical capacity for the full application of genomic tools may represent a greater obstacle to their utilization than the expenses involved The development of these guidelines and the subsequent application of the information contained herein may help to bridge this gap bringing new opportunities to light and transferring knowledge that can be used to increase the genetic characterization of AnGR and subsequently improve the sustainable use and conservation of

Probability and Mathematical Genetics N. H. Bingham, C. M. Goldie, 2010-07-15 Focussing on the work of Sir John Kingman one of the world's leading researchers in probability and mathematical genetics this book touches on the important areas of these subjects in the last 50 years Leading authorities give a unique insight into a wide range of currently topical problems Papers in probability concentrate on combinatorial and structural aspects in particular exchangeability and regeneration The Kingman coalescent links probability with mathematical genetics and is fundamental to the study of the latter This has implications across the whole of genomic modelling including the Human Genome Project Other papers in

mathematical population genetics range from statistical aspects including heterogeneous clustering to the assessment of molecular variability in cancer genomes Further papers in statistics are concerned with empirical deconvolution perfect simulation and wavelets This book will be warmly received by established experts as well as their students and others interested in the content      **Biodiversity and Evolution** Philippe Grandcolas,Marie-Christine Maurel,2018-04-17

Biodiversity and Evolution includes chapters devoted to the evolution and biodiversity of organisms at the molecular level based on the study of natural collections from the Museum of Natural History The book starts with an epistemological and historical introduction and ends with a critical overview of the Anthropocene epoch Explores the study of natural collections of the Museum of Natural History Examines evolution and biodiversity at the molecular level Features an introduction focusing on epistemology and history Provides a critical overview      Estimating Species Trees L. Lacey Knowles,Laura S. Kubatko,2011-05-09 Recent computational and modeling advances have produced methods for estimating species trees directly avoiding the problems and limitations of the traditional phylogenetic paradigm where an estimated gene tree is equated with the history of species divergence The overarching goal of the volume is to increase the visibility and use of these new methods by the entire phylogenetic community by specifically addressing several challenges i firm understanding of the theoretical underpinnings of the methodology ii empirical examples demonstrating the utility of the methodology as well as its limitations and iii attention to technical aspects involved in the actual software implementation of the methodology As such this volume will not only be poised to become the quintessential guide to training the next generation of researchers but it will also be instrumental in ushering in a new phylogenetic paradigm for the 21st century      **Theory and Practice of**

Sober,2024-02-08 Natural selection mutation and adaptation are well known and central topics in Darwin s theory of evolution and in the 20th and 21st century theories which grew out of it but many other important topics are used in

evolutionary biology that raise interesting philosophical questions In this book Elliott Sober analyses a much larger range of topics including fitness altruism common ancestry chance taxonomy phylogenetic inference operationalism reductionism conventionalism null hypotheses and default reasoning instrumentalism versus realism hypothetico deductivism essentialism falsifiability the principle of parsimony the principle of the common cause causality determinism versus indeterminism sensitivity to initial conditions and the knowability of the past Sober's clear philosophical analyses of these key concepts arguments and methods of inference will be valuable for all readers who want to understand evolutionary biology in both its Darwinian and its contemporary forms

**The Evolutionary Biology of Species** Timothy G. Barraclough, 2019 Species are central to understanding the origin and dynamics of biological diversity explaining why lineages split into multiple distinct species is one of the main goals of evolutionary biology. However, the existence of species is often taken for granted and precisely what is meant by species and whether they really exist as a pattern of nature has rarely been modelled or critically tested. This novel book presents a synthetic overview of the evolutionary biology of species describing what species are, how they form, the consequences of species boundaries and diversity for evolution and patterns of species accumulation over time. The central thesis is that species represent more than just a unit of taxonomy; they are a model of how diversity is structured as well as how groups of related organisms evolve. The author adopts an intentionally broad approach, stepping back from the details to consider what species constitute both theoretically and empirically and how we detect them, drawing on a wealth of examples from microbes to multicellular organisms.

**Statistical Modelling in Biostatistics and Bioinformatics** Gilbert MacKenzie, Defen Peng, 2014-05-08 This book presents selected papers on statistical model development related mainly to the fields of Biostatistics and Bioinformatics. The coverage of the material falls squarely into the following categories: a) Survival analysis and multivariate survival analysis, b) Time series and longitudinal data analysis, c) Statistical model development, and d) Applied statistical modelling. Innovations in statistical modelling are presented throughout each of the four areas with some intriguing new ideas on hierarchical generalized non-linear models and on frailty models with structural dispersion, just to mention two examples. The contributors include distinguished international statisticians such as Philip Hougaard, John Hinde, Il Do Ha, Roger Payne, and Alessandra Durio, among others, as well as promising newcomers. Some of the contributions have come from researchers working in the BIO-SI research programme on Biostatistics and Bioinformatics centred on the Universities of Limerick and Galway in Ireland and funded by the Science Foundation Ireland under its Mathematics Initiative.
