Title of my paper: Extraction of Alcohol from Fruit Waste

Statement of purpose: Although production of industry grade alcohol is quite wide spread now, alcohol extraction from fruit waste would be very highly economic. In this project, my aim is to extract alcohol from the various types of fruit wastes and do a comparative study on how much alcohol was obtained from each type of fruit waste.

Background: I have attended lectures on fermentation procedures and alcohol production in the industries. I believe these are going to help me perform the experiment.

Significance: From the results of a successful experiment, a new industry can emerge that uses only fruit waste for extraction of alcohol thus saving quite an amount in purchasing raw materials.

Description: The results will be obtained from experiment.

Methodology: Traditional fermentation processes would be combined with biotechnological methods using specific strains of *Saccharomyces cerevisiae*.

Bibliography: Mainly laboratory manuals were referred to. Microbiology books by Prescott and Pelczar were also of great help.

Croarkin,Stephanie H. Ameis,2016-08-05 Developmental neuroscience research is on the cusp of unprecedented advances in the understanding of how variations in brain structure and function within neural circuits confer

risk for symptoms of childhood psychiatric disorders Novel dimensional approaches to illness classification the availability of non invasive diverse and increasingly sophisticated methods to measure brain structure and function in humans in vivo and advances in genetics animal model and multimodal research now place brain based biomarkers within reach in the field of psychiatry These advances hold great promise for moving neuroscience research into the clinical realm One exciting new area of translational research in child and adolescent psychiatry is in the use of a variety of neuroscience research tools to track brain response to clinical intervention Examples of this include using longitudinal neuroimaging techniques to track changes in white matter microstructure following a training intervention for children with poor reading skills or using functional imaging to compare brain activity before and after children with bipolar disorder begin taking psychotropic medication treatment Brain stimulation is another cutting edge research area where brain response to therapeutic intervention can be closely tracked with electroencephalography or other brain imaging modalities Research using neuroscience tools to track brain response to clinical interventions is beginning to yield novel insights into the etiopathogenesis of psychiatric illness and is providing preliminary feedback around how therapeutic interventions work in the brain to bring about symptom improvement Using these novel approaches neuroscience research may soon move into the clinical realm to target early pathophysiology and tailor treatments to both individuals and specific neurodevelopmental trajectories in an effort to alter the course of development and mitigate risk for a lifetime of morbidity and ineffective treatments Excitement and progress in these areas must be tempered with safety and ethical considerations for these vulnerable populations This research topic focuses on efforts to use neuroscience research tools to identify brain based biomarkers of therapeutic response in child and adolescent psychiatry
