Important note: CAT ratings are test tools and **different** from **functional category ratings** (e.g. PPE gear). CAT ratings are determined by the greatest potential voltage at the workplace that a technician will be exposed to and might experience. PPE requirements are determined by the surface voltage level a user might experience.

Measurement category	As tested	Examples
CAT I ¹	Three-phase or single phase AC supply (residential and industrial installations)	<ul style="list-style-type: none"> Applies to low voltage AC installations (i.e. where the voltage measurement is made in stable power) Excludes circuits carrying continuous inductive loads Excludes load carrying circuits, where the power is heating and demand factor will grow Excludes any inductive loading (inductance less than 100 μH)
CAT II ²	Three phase distribution, including single phase residential supply	<ul style="list-style-type: none"> Applies to most installations, such as buildings and industrial areas Excludes AC distribution Excludes medium voltage circuits, distribution gear, busbars Excludes electrical cable routing Excludes medium and high voltage equipment, including cables
CAT III ³	Single phase overhead overhead lines	<ul style="list-style-type: none"> Substation, transformer, and other electrical and related loads Cables and long length cables <ul style="list-style-type: none"> Excludes all cable work, all overhead and underground CAT III systems Excludes all cable work, all overhead and underground CAT III systems
CAT IV ⁴	Residential	<ul style="list-style-type: none"> Residential installations Residential equipment, including cables in which conductors are used to feed domestic appliances in an immediately live area Any other ratings, test ratings must be marked with a higher rating number (indication, such as the high voltage section of a cable)
