Description

The MON4000 is a multi-band radio frequency (RF) front-end device (FED). It provides two independent channels of RF-to-bits conversion for up to six selectable RF bands. These bands are chosen at time of manufacture from any of the bands allocated to cellular radio signals and for which appropriate 3x3 mm surface acoustic wave (SAW) filters are available. Output data are provided on two gigabit Ethernet (GbE) ports in VITA-49 format for direct compatibility with many signal processing platforms.

To minimise cabling the MON4000 operates from a power-over-Ethernet (PoE) supply. Alternatively it can be powered by a 12 V auxiliary supply.

An on-board GPS receiver provides time stamping for the sampled signals and is also used to stabilise the on-board reference oscillator to provide excellent frequency accuracy and stability.

The high-IF sampling capability of the MON4000 permits the use of a single stage down-converter, whilst maintaining good RF performance, which in turn minimises the design complexity and reduces size and power consumption. A wide range of gain control is available to tailor the down-converter to the prevailing signal conditions; high gain provides the best noise figure, whilst reducing the gain improves the 1 dB compression point.

The two receiver channels may be independently tuned or, with an external link, may share the same local oscillator for phase-coherent operation. Multiple cards may also be synchronised to form larger phase-coherent arrays.

Digitised signals are digitally filtered and decimated by a flexible and reconfigurable baseband processor. The standard build makes provision for a range of output rates to suit the signals of interest, but many

other custom options are possible. The decimated signals are packaged in standard VITA-49 frames for transport to the host computer or signal processor.
