accurate android malware detection and family attribution in this book The authors emphasize the following 1 the scalability over a large malware corpus 2 the resiliency to common obfuscation techniques 3 the portability over different platforms and architectures First the authors propose an approximate fingerprinting technique for android packaging that captures the underlying static structure of the android applications in the context of bulk and offline detection at the app market level This book proposes a malware clustering framework to perform malware clustering by building and partitioning the similarity network of malicious applications on top of this fingerprinting technique Second the authors propose an approximate fingerprinting technique that leverages dynamic analysis and natural language processing techniques to generate Android malware behavior reports Based on this fingerprinting technique the authors propose a portable malware detection framework employing machine learning classification Third the authors design an automatic framework to produce intelligence about the underlying malicious cyber infrastructures of Android malware The authors then leverage graph analysis techniques to generate relevant intelligence to identify the threat effects of malicious Internet activity associated with android malware The authors elaborate on an effective android malware detection system in the online detection context at the mobile device level It is suitable for deployment on mobile devices using machine learning classification on method call sequences Also it is resilient to common code obfuscation techniques and adaptive to operating systems and malware change overtime using natural language processing and deep learning techniques Researchers working in mobile and network security machine learning and pattern recognition will find this book useful as a reference Advanced level students studying computer science within these topic areas will purchase this book as well

Static Analysis for Android Malware Detection Using Document Vectors Utkarsh Raghav,2023 The prevalence of smart mobile devices has led to an upsurge in malware that targets mobile platforms The dominant market player in the sector Android OS has been a favourite target for malicious actors Various feature engineering techniques are used in the current machine learning and deep learning approaches for Android malware detection In order to correctly identify dependable features feature engineering for Android malware detection using multiple AI algorithms requires a particular level of expertise in Android malware and the platform itself The majority of these engineered features are initially extracted by applying different static and dynamic analysis approaches These allow researchers to obtain various types of information from Android application packages APKs such as required permissions opcode sequences and control flow graphs to name a few This information is used as is or in vectorised form for training supervised learning models Researchers have also applied Natural Language Processing techniques to the features extracted from APKs In order to automatically create feature vectors that can describe the data included in Android manifests and Dalvik executable files inside an APK this study focused on developing a novel method that uses static analysis and the NLP technique of document embeddings We designed a system that takes Android APK files as input documents and generates the feature embeddings This system removes the need for manual identification extraction of

features We use these embeddings to train various Android Malware detection models to experimentally evaluate the effectiveness of these automatically generated features The experiments were done by training and evaluating 5 different supervised learning models We did our experiments on APKs from two well known datasets DREBIN and AndroZoo We trained and validated our models with 4000 files training set We had kept separate 700 files test set which were not used during training and validation We used our trained models to predict the classes of the unseen file embeddings from the test set The automatically generated features allowed training of robust detection models The Android malware detection models performed best with Android manifest file embeddings concatenated with Dalvik executable file embeddings with some of the models achieving Precision Recall and Accuracy values above 99% consistently during development and over 97% against unseen file embeddings The prediction accuracy of the detection model trained on our automatically generated features was equivalent to the accuracy achieved by one of the most cited research works known as DREBIN which was 94% We also provided a simple method to directly utilise the file present in Android APK to create feature embeddings without scouring through Android application files to identify reliable features The resulting system can be further improved against new emerging threats and be better trained by just gathering more samples

Android Malware Detection Through Permission and App Component Analysis Using Machine Learning Algorithms Keyur Milind Kulkarni, 2018

Improvement in technology has inevitably altered the tactic of criminals to thievery In recent times information is the real commodity and it is thus subject to theft as any other possessions cryptocurrency credit card numbers and illegal digital material are on the top If globally available platforms for smartphones are considered the Android open source platform AOSP emerges as a prevailing contributor to the market and its popularity continues to intensify Whilst it is beneficiary for users this development simultaneously makes a prolific environment for exploitation by immoral developers who create malware or reuse software illegitimately acquired by reverse engineering Android malware analysis techniques are broadly categorized into static and dynamic analysis Many researchers have also used feature based learning to build and sustain working security solutions Although Android has its base set of permissions in place to protect the device and resources it does not provide strong enough security framework to defend against attacks This thesis presents several contributions in the domain of security of Android applications and the data within these applications First a brief survey of threats vulnerability and security analysis tools for the AOSP is presented Second we develop and use a genre extraction algorithm for Android applications to check the availability of those applications in Google Play Store Third an algorithm for extracting unclaimed permissions is proposed which will give a set of unnecessary permissions for applications under examination Finally machine learning aided approaches for analysis of Android malware were adopted Features including permissions APIs content providers broadcast receivers and services are extracted from benign 2 000 and malware 5 560 applications and examined for evaluation We create feature vector combinations using these features and feed these vectors to various classifiers Based on the evaluation

metrics of classifiers we scrutinize classifier performance with respect to specific feature combination Classifiers such as SVM Logistic Regression and Random Forests spectacle a good performance whilst the dataset of combination of permissions and APIs records the maximum accuracy for Logistic Regression
