Handbook of Optimization Ivan Zelinka, Vaclav Snasael, Ajith Abraham, 2012-09-26 Optimization problems were and still are the focus of mathematics from antiquity to the present Since the beginning of our civilization the human race has had to confront numerous technological

challenges such as finding the optimal solution of various problems including control technologies power sources construction applications in economy mechanical engineering and energy distribution amongst others These examples encompass both ancient as well as modern technologies like the first electrical energy distribution network in USA etc Some of the key principles formulated in the middle ages were done by Johannes Kepler Problem of the wine barrels Johan Bernoulli brachystochrone problem Leonhard Euler Calculus of Variations Lagrange Principle multipliers that were formulated primarily in the ancient world and are of a geometric nature In the beginning of the modern era works of L V Kantorovich and G B Dantzig so called linear programming can be considered amongst others This book discusses a wide spectrum of optimization methods from classical to modern alike heuristics Novel as well as classical techniques is also discussed in this book including its mutual intersection Together with many interesting chapters a reader will also encounter various methods used for proposed optimization approaches such as game theory and evolutionary algorithms or modelling of evolutionary algorithm dynamics like complex networks

Optimization Methods H. Tolle, 2012-12-06 Variational problems which are interesting from physical and technical viewpoints are often supplemented with ordinary differential equations as constraints e g in the form of Newton's equations of motion Since analytical solutions for such problems are possible only in exceptional cases and numerical treatment of extensive systems of differential equations formerly caused computational difficulties in the classical calculus of variations these problems have generally been considered only with respect to their theoretical aspects However the advent of digital computer installations has enabled us approximately since 1950 to make more practical use of the formulas provided by the calculus of variations and also to proceed from relationships which are oriented more numerically than analytically This has proved very fruitful since there are areas in particular in automatic control and space flight technology where occasionally even relatively small optimization gains are of interest Further on if in a problem we have a free function of time which we may choose as advantageously as possible then determination of the absolutely optimal course of this function appears always advisable even if it gives only small improvements or if it leads to technical difficulties since i we must in any case choose some course for free functions a criterion which gives an optimal course for that is very practical ii also when choosing a certain technically advantageous course we mostly want to know to which extent the performance of the system can further be increased by variation of the free function
