The Formation of Econometrics Duo Qin,1993-09-16 Duo Qin has provided a scholarly study of a crucial period in the history of econometrics She traces the formation of econometric theory during the period 1930 1960 and focuses on the formalization of mathematical and scientific processes to analyse economic problems This book deals with the advances made in the practice of econometrics as a discipline in terms of the basic issues is econometric modelling the probability of foundations estimations identification testing and model construction and specification Duo Qin argues that while the probability revolution in econometrics in the early 1940s laid the basis for the systematization of econometric theory it was actually an incomplete revolution and its incompleteness underlay various problems and failures that occurred in applying the newly established theory to modelling practice Model construction and hypothesis testing remained problematic because the basic problem of induction in econometrics was not properly formalized and solved The book thus links early econometric history with many issues of interest to contemporary developments in econometrics

Econometrics in Theory and Practice Panchanan Das,2019-09-05 This book introduces econometric analysis of cross section time series and panel data with the application of statistical software It serves as a basic text for those who wish to learn and apply econometric analysis in empirical research The level of presentation is as simple as possible to make it useful for undergraduates as well as graduate students It contains several examples with real data and Stata programmes and interpretation of the results While discussing the statistical tools needed to understand empirical economic research the book attempts to provide a balance between theory and applied research Various concepts and techniques of econometric analysis are supported by carefully developed examples with the use of statistical software package Stata 15 1 and assumes that the

reader is somewhat familiar with the Stata software. The topics covered in this book are divided into four parts. Part I discusses introductory econometric methods for data analysis that economists and other social scientists use to estimate the economic and social relationships and to test hypotheses about them using real world data. There are five chapters in this part covering the data management issues, details of linear regression models, the related problems due to violation of the classical assumptions. Part II discusses some advanced topics used frequently in empirical research with cross section data. In its three chapters, this part includes some specific problems of regression analysis. Part III deals with time series econometric analysis. It covers intensively both the univariate and multivariate time series econometric models and their applications with software programming in six chapters. Part IV takes care of panel data analysis in four chapters. Different aspects of fixed effects and random effects are discussed here. Panel data analysis has been extended by taking dynamic panel data models which are most suitable for macroeconomic research. The book is invaluable for students and researchers of social sciences, business management, operations research, engineering and applied mathematics.
