**Machine Learners** Adrian Mackenzie, 2017-11-16 If machine learning transforms the nature of knowledge does it also transform the practice of critical thought Machine learning programming computers to learn from data has spread across scientific disciplines media entertainment and government Medical research autonomous vehicles credit transaction processing computer gaming recommendation systems finance surveillance and robotics use machine learning Machine learning devices sometimes understood as scientific models sometimes as operational algorithms anchor the field of data science They have also become mundane mechanisms deeply embedded in a variety of systems and gadgets In contexts from the everyday to the esoteric machine learning is said to transform the nature of knowledge In this book Adrian Mackenzie investigates whether machine learning also transforms the practice of critical thinking Mackenzie focuses on machine learners either humans and machines or human machine relations situated among settings data and devices The settings range from fMRI to Facebook the data anything from cat images to DNA sequences the devices include neural networks support vector machines and decision trees He examines specific learning algorithms writing code and writing about code and develops an archaeology of operations that following Foucault views machine learning as a form of knowledge production and a strategy of power Exploring layers of abstraction data infrastructures coding practices diagrams mathematical formalisms and the social organization of machine learning Mackenzie traces the mostly invisible architecture of one of the central zones of contemporary technological cultures Mackenzie's account of machine learning locates places in which a sense of agency can take root His archaeology of the operational formation of machine learning does not unearth the footprint of a strategic monolith but reveals the local tributaries of force that feed into the generalization and plurality of the field

**Linear Regression** David J. Olive, 2017-04-18 This text covers both multiple linear regression and some experimental design models The text uses the response plot to visualize the model and to detect outliers does not assume that the error distribution has a known parametric distribution develops prediction intervals that work when the error distribution is unknown suggests bootstrap hypothesis tests that may be useful for inference after variable selection and develops prediction regions and large sample theory for the multivariate linear regression model that has  $m$  response variables A relationship between multivariate prediction regions and confidence regions provides a simple way to bootstrap confidence regions These confidence regions often provide a practical method for testing hypotheses There is also a chapter

on generalized linear models and generalized additive models There are many R functions to produce response and residual plots to simulate prediction intervals and hypothesis tests to detect outliers and to choose response transformations for multiple linear regression or experimental design models This text is for graduates and undergraduates with a strong mathematical background The prerequisites for this text are linear algebra and a calculus based course in statistics □□ □
