

7. Wind is the movement of air from an area of higher pressure to lower pressure while an air mass is a parcel of air with similar temperature and humidity throughout.
8. When a high pressure system forms, the air mass cools, particles in the air lose kinetic energy, and the air becomes more dense. Wind is created. Clear skies often occur.
9. When a low pressure system forms, the air mass warms, it expands and rises, making the layer of air thicker. As the air rises, it cools. The water vapour may condense, producing clouds or precipitation.

6. Warm ocean water and winds lift moist air high into the atmosphere. The water vapour condenses, producing clouds and rain. The rising air produces a

low pressure area at the ocean's surface. Warm air rushes down towards the low pressure area. The Coriolis effect forces the air to rotate, causing a massive, spinning storm.

1. A decrease in the amount of greenhouse gases would lower the temperature on Earth.
2. An increase in the tilt of Earth would result in extreme seasonal changes. In the northern hemisphere, winters would be colder and summers would be warmer.
3. A change in Earth's wobble will affect the angle of incidence of the Sun's rays.
4. When Earth's orbit is elliptical, Earth's orbit takes it farther from the Sun, and less solar radiation reaches Earth's surface.
5. As yearly temperatures increase, the atmosphere holds more water vapour and traps more thermal energy. The resulting increase in temperature causes more water to evaporate.
