Teil 3, Elektrische geschweißte und unterpulvergeschweißte Rohre aus legierten Feinkornbaustählen mit festgelegten Eigenschaften bei Raum-, erhöhten und tiefen Temperaturen ,2019 Welded and Cold-Drawn, High Strength (690 MPa Tensile Strength) Low Alloy Steel Hydraulic Tubing, Stress Relieved Annealed for Bending, Flaring, Cold Forming and Brazing Metallic Tubing Committee,2018 This specification covers stress relieved annealed electric resistance welded and cold drawn single wall high strength low alloy steel tubing intended for use in hydraulic pressure lines and in other applications requiring tubing of a quality suitable for bending flaring cold forming and brazing The grade of material produced to this specification is of micro alloy content Nominal reference working pressures for this tubing are listed in ISO 10763 and SAE J1065 CAUTION Sub critically annealed steels are often produced using anneal temperatures below the Lower Critical Temperature AC1 of the given steel to achieve the desired strength levels Welding brazing or other processing methods that subject the tube material or assembly to temperatures near or above AC1 might initiate isothermal transformation of the tube microstructure and compromise the strength of the tube in the heat affected zone by further annealing the tube Therefore ISO 10763 and SAE***

J1065 nominal reference working pressures might not be applicable. It is recommended that the user and the fabricator validate and agree that the tube assembly design and pressure ratings are not compromised beyond system design from these processes. Performance testing as described in SAE J2551-2 will facilitate appropriate test recommendations. Braze and or welded tube assembly configurations made to specific geometry and components in association with this material may require qualification testing in accordance with ISO 19879 Test Methods for Hydraulic Fluid Power Connections. Cold forming the tube end connections in place of thermal processes such as brazing and welding avoids this systemic testing by not compromising the structural integrity of the tube material. In an effort to standardize within a global marketplace and ensure that companies can remain competitive in an international market, it is the intent to convert to metric tube sizes which will lead to one global system. Guide users to preferred system. Reduce complexity. Eliminate inventory duplications. This SAE Standard has been revised as part of a Five Year Review. Document changes include revisions to the Scope, Applicable and Related Publications, lists, updated thermal process warning, additional Section 3 Manufacture drawing requirement, and Section 8.8 Pressure Proof Test information. Verbiage has been updated throughout the standard to align the document with other recently revised tube standards.

Welded and Cold Drawn Low-Carbon Steel Tubing Annealed for Bending and Flaring Hydraulic Tube Fittings Committee, 1996. This SAE Standard covers cold worked and annealed electric resistance welded single wall low carbon steel pressure tubing intended for use as hydraulic lines and in other applications requiring tubing of a quality suitable for flaring and bending.

Welded and Cold-Drawn, High Strength (500 MPa Tensile Strength) Low Alloy Steel Hydraulic Tubing, Sub-Critically Annealed for Bending and Flaring Metallic Tubing Committee, 2009. This specification covers sub-critically annealed electric resistance welded and cold drawn single wall high strength low alloy steel tubing intended for use in hydraulic pressure lines and in other applications requiring tubing of a quality suitable for bending, flaring, cold forming, welding, and brazing. The grade of material produced to this specification is of micro alloy content and is considerably stronger and intended to service higher pressure applications than like sizes of the grades of material specified in SAE J525 and SAE J2467. Due to the alloy content of the material, the forming characteristics of the finished tube are equal to or better when compared to SAE J525 and SAE J2467. Nominal reference working pressures for this tubing are listed in ISO 10763 for metric tubing and SAE J1065 for inch tubing. CAUTION: When brazing or welding is used as a tube end joining method, the structural integrity of the tube material can potentially be compromised due to the degradation of the areas affected by the thermal effect applied to the tubing; therefore, the ISO 10763 and SAE J1065 nominal reference working pressures may not be applicable. Braze and or welded tube assembly configurations made to specific geometry and components bill of material in association with this material may require qualification testing in accordance with ISO 19879 Test Methods for Hydraulic Fluid Power Connections. Cold forming the tube end configurations avoids this systemic testing by not compromising the tube material structural integrity. This SAE standard has been revised as part of the
