Zemax Diode Collimator:

A Practical Guide to Handling Laser Diode Beams Haiyin Sun, 2015-02-20 This book offers the reader a practical guide to the control and characterization of laser diode beams Laser diodes are the most widely used lasers accounting for 50% of the global laser market Correct handling of laser diode beams is the key to the successful use of laser diodes and this requires an in depth understanding of their unique properties Following a short introduction to the working principles of laser diodes the book describes the basics of laser diode beams and beam propagation including Zemax modeling of a Gaussian beam propagating through a lens The core of the book is concerned with laser diode beam manipulations collimating and focusing circularization and astigmatism correction coupling into a single mode optical fiber diffractive optics and beam shaping and manipulation of multi transverse mode beams The final chapter of the book covers beam characterization methods describing the measurement of spatial and spectral properties including wavelength and linewidth measurement techniques The book is a significantly revised and expanded version of the title Laser Diode Beam Basics Manipulations and Characterizations by the same author New topics introduced in this volume include laser diode types and working principles non paraxial Gaussian beam Zemax modeling numerical analysis of a laser diode beam spectral property characterization methods and power and energy characterization techniques The book approaches the subject in a practical way with mathematical content kept to the minimum level required making the book a convenient reference for laser diode users *Laser Diodes and LEDs in Industrial, Measurement, Imaging, and Sensors Applications II* Geoffrey T.

Burnham, 2000 **Recent Advances in Computer Science and Information Engineering** Zhihong Qian, Lei Cao, Weilian Su, Tingkai Wang, Huamin Yang, 2012-02-04 CSIE 2011 is an international scientific Congress for distinguished scholars engaged in scientific engineering and technological research dedicated to build a platform for exploring and discussing the future of Computer Science and Information Engineering with existing and potential application scenarios The congress has been held twice in Los Angeles USA for the first and in Changchun China for the second time each of which attracted a large number of researchers from all over the world The congress turns out to develop a spirit of cooperation that leads to new friendship for addressing a wide variety of ongoing problems in this vibrant area of technology and fostering more collaboration over the world The congress CSIE 2011 received 2483 full paper and abstract submissions from 27 countries and regions over the world Through a rigorous peer review process all submissions were refereed based on their quality of content level of innovation significance originality and legibility 688 papers have been accepted for the international congress proceedings ultimately **Tailoring the Emission of Stripe-array Diode Lasers with External Cavities to Enable Nonlinear Frequency Conversion** Andreas Jechow, 2009 A huge number of applications require coherent radiation in the visible spectral range Since diode lasers are very compact and efficient light sources there exists a great interest to cover these applications with diode laser emission Despite modern band gap engineering not all wavelengths can be

accessed with diode laser radiation Especially in the visible spectral range between 480 nm and 630 nm no emission from diode lasers is available yet Nonlinear frequency conversion of near infrared radiation is a common way to generate coherent emission in the visible spectral range However radiation with extraordinary spatial temporal and spectral quality is required to pump frequency conversion Broad area BA diode lasers are reliable high power light sources in the near infrared spectral range They belong to the most efficient coherent light sources with electro optical efficiencies of more than 70% Standard BA lasers are not suitable as pump lasers for frequency conversion because of their poor beam quality and spectral properties For this purpose tapered lasers and diode lasers with Bragg gratings are utilized However these new diode laser structures demand for additional manufacturing and assembling steps that makes their processing challenging and expensive An alternative to BA diode lasers is the stripe array architecture The emitting area of a stripe array diode laser is comparable to a BA device and the manufacturing of these arrays requires only one additional process step Such a stripe array consists of several narrow striped emitters realized with close proximity Due to the overlap of the fields of neighboring emitters or the presence of leaky waves a strong coupling between the emitters exists As a consequence the emission of such an array is characterized by a so called supermode However for the free running stripe array mode competition between several supermodes occurs because of the lack of wavelength stabilization This leads to power fluctuations spectral instabilities and poor beam quality Thus it was necessary to study the emission properties of those stripe arrays to find new concepts to realize an external synchronization of the emitters The aim was to achieve stable longitudinal and transversal single mode operation with high output powers giving a brightness sufficient for efficient nonlinear frequency conversion For this purpose a comprehensive analysis of the stripe array devices was done here The physical effects that are the origin of the emission characteristics were investigated theoretically and experimentally In this context numerical models could be verified and extended A good agreement between simulation and experiment was observed One way to stabilize a specific supermode of an array is to operate it in an external cavity Based on mathematical simulations and experimental work it was possible to design novel external cavities to select a specific supermode and stabilize all emitters of the array at the same wavelength This resulted in stable emission with 1 W output power a narrow bandwidth in the range of 2 MHz and a very good beam quality with M
