**The Distributed Classroom** David A. Joyner, Charles Isbell, 2023-08-01 A vision of the future of education in which the classroom experience is distributed across space and time without compromising learning What if there were a model for learning in which the classroom experience was distributed across space and time and students could still have the benefits of the traditional classroom even if they can't be present physically or learn synchronously In this book two experts in online learning envision a future in which education from kindergarten through graduate school need not be tethered to a single physical classroom The distributed classroom would neither sacrifice students social learning experience nor require massive development resources It goes beyond hybrid learning so ubiquitous during the COVID 19 pandemic and MOOCs so trendy a few years ago to reimagine the classroom itself David Joyner and Charles Isbell both of Georgia Tech explain how recent developments including distance learning and learning management systems have paved the way for the distributed classroom They propose that we dispense with the dichotomy between online and traditional education and the assumption that online learning is necessarily inferior They describe the distributed classroom's various delivery modes for in person students remote synchronous students and remote asynchronous students the goal would be a symmetry of experiences with both students and teachers able to move from one mode to another With *The Distributed Classroom* Joyner and Isbell offer an optimistic learner centric view of the future of education in which every person on earth is turned into a potential learner as barriers of cost geography and synchronicity disappear

**Professional Development for In-Service Teachers** Chrystalla Mouza, Anne Ottenbreit-Leftwich, Aman Yadav, 2022-07-01 Computer science is increasingly becoming an essential 21st century skill As school systems around the world recognize the importance of computer science demand for teachers who have the knowledge and skills to deliver computer science instruction is rapidly growing Yet a number of recent studies indicate that teachers report low confidence

and limited understanding of computer science frequently confusing basic computer literacy skills with computer science. This is true for both teachers at the K-8 level as well as secondary education teachers who frequently transition to computer science from other content areas such as mathematics. As computer science is not yet included in most teacher preparation programs, professional development is a critical step in efforts to prepare in-service teachers to deliver high quality computer science instruction. To date, however, research on best practices in computer science professional development has been severely lacking in the literature, making it difficult for researchers and practitioners alike to examine effective in-service preparation models. This book provides examples of professional development approaches that help teachers integrate aspects of computing in existing curricula at the K-8 level or deliver stand-alone computer science courses at the secondary school level. Further, this book identifies computational competencies for teachers, promising pedagogical strategies that advance teacher learning, as well as alternative pathways for ongoing learning, including microcredentials. The primary audience of the book is graduate students and faculty in educational technology, educational or cognitive psychology, learning theory, curriculum and instruction, computer science, instructional systems, and learning sciences. Additionally, the book will serve as a valuable addition to education practitioners and curriculum developers, as well as policy makers looking to increase the number of teachers who are prepared to deliver computing education.
