

Chapter 2

2.3 Since m is not a prime, it can be factored as the product of two integers a and b ,

$$m = a \cdot b$$

with $1 < a, b < m$. It is clear that both a and b are in the set $\{1, 2, \dots, m-1\}$. It follows from the definition of modulo- m multiplication that

$$a \square b = 0.$$

Since 0 is not an element in the set $\{1, 2, \dots, m-1\}$, the set is not closed under the modulo- m multiplication and hence can not be a group.

2.5 It follows from Problem 2.3 that, if m is not a prime, the set $\{1, 2, \dots, m-1\}$ can not be a group under the modulo- m multiplication. Consequently, the set $\{0, 1, 2, \dots, m-1\}$ can not be a field under the modulo- m addition and multiplication.

2.7 First we note that the set of sums of unit element contains the zero element 0. For any $1 \leq \ell < \lambda$,

$$\sum_{i=1}^{\ell} 1 + \sum_{i=1}^{\lambda-\ell} 1 = \sum_{i=1}^{\lambda} 1 = 0.$$

Hence every sum has an inverse with respect to the addition operation of the field $\text{GF}(q)$. Since the sums are elements in $\text{GF}(q)$, they must satisfy the associative and commutative laws with respect to the addition operation of $\text{GF}(q)$. Therefore, the sums form a commutative group under the addition of $\text{GF}(q)$.

Next we note that the sums contain the unit element 1 of $\text{GF}(q)$. For each nonzero sum

$$\sum_{i=1}^{\ell} 1$$

with $1 \leq \ell < \lambda$, we want to show it has a multiplicative inverse with respect to the multiplication operation of $\text{GF}(q)$. Since λ is prime, ℓ and λ are relatively prime and there exist two

Digital Communication Edward A. Lee, David G. Messerschmitt, 2012-12-06 This book concerns digital communication Specifically we treat the transport of bit streams from one geographical location to another over various physical media such as wire pairs coaxial cable optical fiber and radio waves Further we cover the multiplexing multiple access and synchronization issues relevant to constructing communication networks that simultaneously transport bit streams from many users The material in this book is thus directly relevant to the design of a multitude of digital communication systems including for example local and metropolitan area data networks voice and video telephony systems the integrated services digital network ISDN computer communication systems voiceband data modems and satellite communication systems We extract the common principles underlying these and other applications and present them in a unified framework This book is intended for designers and would be designers of digital communication systems To limit the scope to manageable proportions we have had to be selective in the topics covered and in the depth of coverage In the case of advanced

information coding and detection theory for example we have not tried to duplicate the in depth coverage of many advanced textbooks but rather have tried to cover those aspects directly relevant to the design of digital communication systems
