

Are you following me so far? Let me describe these terms once again but in plain English:

- ✓ Advertised distance: How far the destination is away for your neighbor.
- ✓ Feasible distance: The total distance to the destination.

The best path to the destination is called the **successor**!

The successor will be copied from the topology table to the routing table.

With EIGRP however it's possible to have a backup path which we call the **feasible successor**. How do we find out if we have a feasible successor? Let's find out:

In the example above we have a couple of routers running EIGRP; we are sitting on the router without a name on the left side and would like to know two things:

- ✓ Which path is the successor (the best path)?
- ✓ Do we have any feasible successors? (backup paths)
