

Abelian Groups

If $\langle G, \bullet \rangle$ is a group and \bullet is also commutative then $\langle G, \bullet \rangle$ is referred to as an *Abelian group* (the name is taken from the 19'th century mathematician N.H. Abel)

\bullet is commutative means that

$$\forall a, b \in G, a \bullet b = b \bullet a$$

Examples: $\langle \mathbb{R}, + \rangle, \langle \mathbb{Z}, + \rangle$ and $\langle \mathbb{R} - \{0\}, \times \rangle$ are abelian groups.

Why is $\langle \mathbb{R}, \times \rangle$ not a group at all?

$$\begin{aligned} \text{If } \forall a, b \in \mathbb{Z} \quad a \oplus b &= a + b \text{ if } a + b < n \\ &= a + b - n \text{ if } a + b \geq n \end{aligned}$$

then $\langle \mathbb{Z}, \oplus \rangle$ is an abelian group and is usually referred to as the group of *integers modulo n*

Congressus Numerantium , 2003 *The Geometric Vein* C. Davis, B. Grünbaum, F.A. Sherk, 2012-12-06 Geometry has been defined as that part of mathematics which makes appeal to the sense of sight but this definition is thrown in doubt by the existence of great geometers who were blind or nearly so such as Leonhard Euler Sometimes it seems that geometric methods in analysis so called consist in having recourse to notions outside those apparently relevant so that geometry must be the joining of unlike strands but then what shall we say of the importance of axiomatic programmes in geometry where reference to notions outside a restricted repertoire is banned Whatever its definition geometry clearly has been more than the sum of its results more than the consequences of some few axiom sets It has been a major current in mathematics with a distinctive approach and a distinctive spirit A current furthermore which has not been constant In the 1930s after a period of pervasive prominence it appeared to be in decline even passed These same years were those in which H S M Coxeter was beginning his scientific work Undeterred by the unfashionability of geometry Coxeter pursued it with devotion and inspiration By the 1950s he appeared to the broader mathematical world as a consummate practitioner of a peculiar out of the way art Today there is no longer anything that out of the way about it Coxeter has contributed to exemplified we could almost say presided over an unanticipated and dramatic revival of geometry *Cosmology and Gravitation* Peter G. Bergmann, Venzo De Sabbata, 2012-12-06 For the Sixth Course of the International School of Cosmology and Gravitation of the Ettore Majorana Centre for Scientific Culture we choose as the principal topics torsion and supergravity because in our opinion it is one of the principal tasks of today's theoretical physics to attempt to link together the theory of elementary particles and general relativity Our aim was to delineate the present status of the principal efforts directed toward this end

and to explore possible directions of work in the near future Efforts to incorporate spin as a dynamic variable into the foundations of the theory of gravitation were pioneered by E Cartan whose contributions to this problem go back half a century According to A Trautman this so called Einstein Cartan theory is the simplest and most natural modification of Einstein's 1916 theory F Hehl has contributed a very detailed and comprehensive analysis of this topic original view of non Riemannian space time Characteristic of Einstein Cartan theories is the enrichment of Riemannian geometry by torsion the non symmetric part of the otherwise metric compatible affine connection Torsion has a impact on the theory of elementary particles According to V de Sabbata weak interactions can be based on the Einstein Cartan geometry in that the Lagrangian describing weak interactions and torsion interaction possess analogous structures leading to a unification of weak and gravitational forces

Radomir S. Stankovic, Claudio Moraga, Jaakko Astola, 2005-08-08 Discover applications of Fourier analysis on finite non Abelian groups The majority of publications in spectral techniques consider Fourier transform on Abelian groups However non Abelian groups provide notable advantages in efficient implementations of spectral methods Fourier Analysis on Finite Groups with Applications in Signal Processing and System Design examines aspects of Fourier analysis on finite non Abelian groups and discusses different methods used to determine compact representations for discrete functions providing for their efficient realizations and related applications Switching functions are included as an example of discrete functions in engineering practice Additionally consideration is given to the polynomial expressions and decision diagrams defined in terms of Fourier transform on finite non Abelian groups A solid foundation of this complex topic is provided by beginning with a review of signals and their mathematical models and Fourier analysis Next the book examines recent achievements and discoveries in Matrix interpretation of the fast Fourier transform Optimization of decision diagrams Functional expressions on quaternion groups Gibbs derivatives on finite groups Linear systems on finite non Abelian groups Hilbert transform on finite groups Among the highlights is an in depth coverage of applications of abstract harmonic analysis on finite non Abelian groups in compact representations of discrete functions and related tasks in signal processing and system design including logic design All chapters are self contained each with a list of references to facilitate the development of specialized courses or self study With nearly 100 illustrative figures and fifty tables this is an excellent textbook for graduate level students and researchers in signal processing logic design and system theory as well as the more general topics of computer science and applied mathematics Catalog of Copyright Entries. Residuated Structures in Algebra and Logic George Metcalfe, Francesco Paoli, Constantine Tsinakis, 2023-11-06 This book is an introduction to residuated structures viewed as a common thread binding together algebra and logic The framework includes well studied structures from classical abstract algebra such as lattice ordered groups and ideals of rings as well as structures serving as algebraic semantics for substructural and other non classical logics Crucially classes of these structures are studied both algebraically yielding a rich structure theory along the lines of Conrad s program for lattice ordered groups and algorithmically via analytic sequent or hypersequent calculi These perspectives are related using a natural notion of equivalence for consequence relations that provides a bridge offering benefits to both sides Algorithmic methods are used to establish properties like decidability amalgamation and generation by subclasses while new insights into logical systems are obtained by studying associated classes of structures The book is designed to serve the purposes of novices and experts alike The first three chapters provide a gentle introduction to the subject while subsequent chapters provide a state of the art account of recent developments in the field
