Tracking and Sensor Data Fusion Wolfgang Koch, 2013-09-20 Sensor Data Fusion is the process of combining incomplete and imperfect pieces of mutually complementary sensor information in such a way that a better understanding of an underlying real world phenomenon is achieved Typically this insight is either unobtainable otherwise or a fusion result exceeds what can be produced from a single sensor output in accuracy reliability or cost This book provides an introduction Sensor Data Fusion as an information technology as well as a branch of engineering science and informatics Part I presents a coherent methodological framework thus providing the prerequisites for discussing selected applications in Part II of the book The presentation mirrors the author s views on the subject and emphasizes his own contributions to the development of particular aspects With some delay Sensor Data Fusion is likely to develop along lines similar to the evolution of another modern key technology whose origin is in the military domain the Internet It is the author s firm conviction that until now scientists and engineers have only scratched the surface of the vast range of opportunities for research engineering and product development that still waits to be explored the Internet of the Sensors Vision, Modeling, and Visualization 2008 Oliver Deussen, 2008

Audio-visual Person Tracking: A Practical Approach Fotios Talantzis, Aristodemos Pnevmatikakis, Anthony G Constantinides, 2011-12-23 This book deals with the creation of the algorithmic backbone that enables a computer to perceive humans in a monitored space This is performed using the same signals that humans process i e audio and video Computers reproduce the same type of perception using sensors and algorithms in order to detect and track multiple interacting humans by way of multiple cues like bodies faces or speech This application domain is challenging because audio and visual signals are cluttered by both background and foreground objects First particle filtering is established as the framework for tracking Then audio visual and also audio visual tracking systems are separately explained Each modality is analyzed starting with sensor configuration detection for tracker initialization and the trackers themselves Techniques to fuse the modalities are then considered Instead of offering a monolithic approach to the tracking problem this book also focuses on implementation by providing MATLAB code for every presented component This way the reader can connect every concept with corresponding code Finally the applications of the various tracking systems in different domains are studied a

Computer Simulation of Aerial Target Radar Scattering, Recognition,

Detection, and Tracking Yakov D. Shirman, 2002 Here's a ground breaking new book that provides you with the knowledge you need to perform effective computer simulation of scattering for the real targets and conditions of radio wave propagation. By replacing field tests with the computer simulation methods presented in this unique resource you save time and money in the early stages of research and development. Supplemented with 283 equations and 121 illustrations you get practical guidance in estimating the effect of various signatures of new radar with target recognition, evaluating and comparing the effectiveness and complexity of recognition algorithms before they are actually introduced into radar, formulating requirements to radar subsystems and evaluating their tolerances and predicting future radar performance. What's more the book helps you perform initial simulation of the recognition algorithm in various conditions where the practical receiving of experimental data is restricted. Other key discussions include the theory of target recognition, results of studying various recognition methods and simulation in radar detection and tracking.
