

ASCE 7-05 Wind Pressures

- The basic form of the pressure equation:

$$p = qGC$$

- Where
 - p = a wind pressure on a surface
 - q = velocity pressure. This is the pressure due to a moving fluid on a flat plate
 - G = gust factor. The gust factor accounts for dynamic interaction between the flowing air and the structure
 - C = pressure coefficient. The pressure coefficient accounts for varying pressure across a surface.

Time-Dependent Behaviour of Concrete Structures Raymond Ian Gilbert, Gianluca Ranzi, 2010-09-21 Serviceability failures of concrete structures involving excessive cracking or deflection are relatively common even in structures that comply with code requirements This is often as a result of a failure to adequately account for the time dependent deformations of concrete in the design of the structure The serviceability provisions embodied in codes of practice are relatively crude and in some situations unreliable and do not adequately model the in service behaviour of structures In particular they fail to adequately account for the effects of creep and shrinkage of the concrete Design for serviceability is complicated by the non linear and inelastic behaviour of concrete at service loads Providing detailed information this book helps engineers to rationally predict the time varying deformation of concrete structures under typical in service conditions It gives analytical methods to help anticipate time dependent cracking the gradual change in tension stiffening with time creep induced deformations and the load independent strains caused by shrinkage and temperature changes The calculation procedures are illustrated with many worked examples A vital guide for practising engineers and advanced students of structural engineering on the design of concrete structures for serviceability and provides a penetrating insight into the time dependent behaviour of reinforced and prestressed concrete structures

Mazzolani, 1983 *Nonlinear Equations for Beams and Degenerate Plates with Piers* Maurizio Garrione, Filippo Gazzola, 2019-10-31 This book develops a full theory for hinged beams and degenerate plates with multiple intermediate piers with the final purpose of understanding the stability of suspension bridges New models are proposed and new tools are provided for the stability analysis The book opens by deriving the PDE's based on the physical models and by introducing the basic framework for the linear stationary problem The linear analysis in particular the behavior of the eigenvalues as the position of the piers varies enables the authors to tackle the stability issue for some nonlinear evolution beam equations with the aim of determining the best position of the piers within the beam in order to maximize its stability The study continues with the analysis of a class of

degenerate plate models The torsional instability of the structure is investigated and again the optimal position of the piers in terms of stability is discussed The stability analysis is carried out by means of both analytical tools and numerical experiments Several open problems and possible future developments are presented The qualitative analysis provided in the book should be seen as the starting point for a precise quantitative study of more complete models taking into account the action of aerodynamic forces This book is intended for a two fold audience It is addressed both to mathematicians working in the field of Differential Equations Nonlinear Analysis and Mathematical Physics due to the rich number of challenging mathematical questions which are discussed and left as open problems and to Engineers interested in mechanical structures since it provides the theoretical basis to deal with models for the dynamics of suspension bridges with intermediate piers More generally it may be enjoyable for readers who are interested in the application of Mathematics to real life problems
