

Thermodynamics in a Closed Thermodynamic Loop

Background theory

Thermodynamics is a discipline which describes how macroscopic properties emerge from microscopic ones. These macroscopic (bulk) properties emerge as a result of the collective behaviour of a vast number of microscopic entities (atoms). When the plant is activated, the entire loop will be cooled, when the refrigerant will go through its compression at this stage in temperature in the condenser, when heat is added.

Heat will be added from the condenser and the refrigerant will change its state. Heat is added that is the temperature increases and when the refrigerant is then will be gas. The whole process is different, which means that the refrigerant is added to the loop and the whole process is different, which means that the refrigerant is added to the loop and the whole process is different.

Materials:

- Refrigerant (R134a)

- Refrigerant (R134a) (100 g)
- Refrigerant (R134a) (100 g)

Procedure:

Part A:

1. Measure the initial temperature of the refrigerant in a 100 ml graduated cylinder and record it in the laboratory logbook.
2. Measure the initial temperature of the water.
3. Measure the initial temperature of the water.
4. Add the 100 g of refrigerant to the water and quickly measure the temperature.
5. Measure the temperature and record the highest and lowest temperatures in your data table.

Compact Overhead Line Design Rob Stephen, Javier Iglesias, 2023-12-25 This Green Book provides the design engineer with an understanding of the electrical parameters and methods required in designing compact AC and DC lines Compact AC and DC lines are becoming increasingly necessary due to the limitation of right of way access and the need to upgrade power transfer in existing narrower line corridors Another requirement for compact AC lines is the lower impedance permitting increased power flow For DC power lines increased power flow can only be realised by increasing the current through the conductors and or increasing line voltage In AC it can also be achieved by bundle expansion and phase compaction due to the variation of impedance The effect of compaction on AC and DC lines is not identical as with the constraints The Green Book covers the theory relating to the constraints such as corona audible noise insulation coordination electric and magnetic fields and others for both AC and DC lines In addition to the theory the Green Book includes actual calculations of electric parameters for different pole DC and phase AC configurations Standards applied by various countries are tabulated for easy comparison of practices internationally Case studies on line compaction designs for both AC and DC are described with relation to pole compaction pole rearrangement and phase configuration Voltage upgrading is also treated in this book and some case studies for both AC and DC are considered Readers who would like to comment on any of the published books or identify errors to the editorial team please contact cigregreenbooks@springer.com *Chemistry* McGraw-Hill Staff, 2001-07
