Directed Energy Weapons Bahman Zohuri, 2016-08-29 This book delves deeply into the real world technologies behind the directed energy weapons that many believe exist only within the confines of science fiction. On the contrary, directed energy weapons such as high energy lasers are very real, and this book provides a crash course in all the physical and mathematical concepts that make these weapons a reality. Written to serve both scientists researching the physical phenomena of laser effects as well as engineers focusing on practical applications, the author provides worked examples demonstrating issues such as how to solve for the heat diffusion equation for different boundary and initial conditions. Several sections are devoted to reviewing and dealing with solutions of diffusion equations utilizing the aid of the integral transform techniques. Ultimately, this book examines the state of the art in currently available high energy laser technologies and suggests future directions for accelerating practical applications in the field. **Dennis G. Zill, Warren S. Wright**, 2009-12-21 Now with a full color design, the new Fourth Edition of Zill's *Advanced Engineering Mathematics* provides an in-depth overview of the many mathematical topics necessary for students planning a career in engineering or the sciences. A key strength of this text is Zill's emphasis on differential equations as mathematical models, discussing the constructs and pitfalls of each. The Fourth Edition is comprehensive yet flexible to meet the unique needs of various course offerings, ranging from ordinary differential equations to vector calculus. Numerous new projects contributed by esteemed mathematicians have been added. New modern applications and engaging projects make Zill's classic text a must-have text and resource for Engineering Math students. *Advanced Engineering Mathematics* Dennis G. Zill, 2020-12-01 This package includes the printed hardcover book and access to the Navigate 2 Companion Website. The seventh edition of *Advanced Engineering Mathematics* provides learners with a modern and comprehensive compendium of topics that are most often covered in courses in engineering mathematics and is extremely flexible to meet the unique needs of courses ranging from ordinary differential equations to vector calculus to partial differential equations. Acclaimed author Dennis G. Zill's accessible writing style and strong pedagogical aids guide students through difficult concepts with thoughtful explanations, clear examples, interesting applications, and contributed project problems. **Differential Equations with Boundary-value Problems** Dennis G. Zill, 1989 Includes solutions to odd-numbered exercises. **A First Course in Complex Analysis** Allan R. Willms, 2022-04-20 This book introduces complex analysis and is appropriate for a first course in the subject at typically the third-year University level. It introduces the exponential function very early but does so rigorously. It covers the usual topics of functions, differentiation, analyticity, contour integration, the theorems of Cauchy and their many consequences, Taylor and Laurent series, residue theory, the computation of certain improper real integrals, and a brief introduction to conformal mapping. Throughout the text, an emphasis is placed on geometric properties of complex numbers and visualization of complex mappings. **The Calculus of Complex Functions** William Johnston, 2022-04-01 The book introduces complex

analysis as a natural extension of the calculus of real valued functions The mechanism for doing so is the extension theorem which states that any real analytic function extends to an analytic function defined in a region of the complex plane The connection to real functions and calculus is then natural The introduction to analytic functions feels intuitive and their fundamental properties are covered quickly As a result the book allows a surprisingly large coverage of the classical analysis topics of analytic and meromorphic functions harmonic functions contour integrals and series representations conformal maps and the Dirichlet problem It also introduces several more advanced notions including the Riemann hypothesis and operator theory in a manner accessible to undergraduates The last chapter describes bounded linear operators on Hilbert and Banach spaces including the spectral theory of compact operators in a way that also provides an excellent review of important topics in linear algebra and provides a pathway to undergraduate research topics in analysis The book allows flexible use in a single semester full year or capstone course in complex analysis Prerequisites can range from only multivariate calculus to a transition course or to linear algebra or real analysis There are over one thousand exercises of a variety of types and levels Every chapter contains an essay describing a part of the history of the subject and at least one connected collection of exercises that together comprise a project level exploration
