### Introduction to Data Structures

#### Introduction to the Theory of Data Structures:

**DATA:** Data is a collection of facts, such as numbers, words, measurements, observations or just descriptions of things.

**STRUCTURE:** The **structure** of something is the way in which it is made, **built**, or **organized**.

**DATA STRUCTURES:** A data structure is a special way of storing and organizing data in a computer so that it can be used efficiently.

**Array, Linked List, Stack, Queue, Tree, Graph** etc are all data structures that **stores the data** in a special way so that we can access and use the data **efficiently**.

**Algorithm + Data Structure = Program**

- The data structure is not any programming language like C, C++, java, etc. It is a set of algorithms that we can use in any programming language to structure the data in the memory.
- To structure the data in memory, 'n' number of algorithms were proposed, and all these algorithms are known as Abstract data types. These abstract data types are the set of rules.

- A programmer selects an appropriate data structure and uses it according to their convenience.
- For example, if we have an employee's data like name 'ABC' and salary 10000. Here, 'ABC' is of String data type and 10000 is of Float data type.  
We can organize this data as a record like Employee record and collect & store employee's records in a file or database as a data structure like 'ABC' 10000, 'PQR' 15000, 'STU' 5000.
- Data structure is about providing data elements in terms of some relationship for better organization and storage.
- It is a specialized format for organizing and storing data that can be accessed within appropriate ways.

#### **Why is Data Structure Important?**

- Data structure is important because it is **used in almost every program or software system**.
- It helps to **write efficient code**, structures the code and solve problems.
- **Data can be maintained more easily** by encouraging a better design or implementation.
- **Data structure is just a container for the** data that is used to store, manipulate and arrange. It can be processed by algorithms.

For example, while using a shopping website like Flipkart or Amazon, the users know their last orders and can track them. The orders are stored in a database as records.
