Differential Diagnosis and Physical Therapy Management of a Patient With Radial Wrist Pain of 6 Months' Duration: A Case Report

When evaluating a patient with radial wrist pain, clinicians need to consider a number of possible etiologies, including systemic disease, referred pain to the radial aspect of the wrist, and local tissue dysfunction. A commonly considered local tissue dysfunction in patients with radial wrist pain is De Quervain syndrome or stenosing tenosynovitis of the first dorsal compartment.¹⁰

Although implying an inflammatory etiology, the histopathology of stenosing tenosynovitis is generally characterized

by fibrosis and fibrocartilaginous metaplasia leading to thickening of the extensor retinaculum in the absence of inflamma-

tory findings. The sliding impairment of the entrapped but normal abductor pollicis longus and extensor pollicis brevis tendons within the stenosed extensor compartment is thought to be responsible for the symptoms.¹ Epidemiological studies in industrial settings have shown a point prevalence of 8% for De Quervain syndrome, when wrist pain and a positive Finkelstein test, with or without tenderness to palpation of the radial wrist, were used as diagnostic criteria.^{23,24} More relevant to nonindustrial settings, in 485 patients with upper extremity musculoskeletal disorders consisting mostly of computer users and musicians, 17% were diagnosed with De Quervain syndrome on the right and 5% on the left, based solely on a positive Finkelstein test.²⁵

Relevant to a patient with radial wrist pain is the differential diagnosis between stenosing tenosynovitis and an entrapment neuropathy of the superficial radial nerve.²² Moore²² described the superficial radial nerve as a critical neural structure in this area. After crossing the elbow, the radial nerve splits and forms the posterior interosseous nerve and the superficial sensory branch of the radial nerve, which supplies the sensation to the radial aspect of the forearm and wrist. This superficial sensory branch courses

• **STUDY DESIGN:** Case report.

• **BACKGROUND:** Differential diagnosis for patients with radial wrist pain requires consideration of systemic disease, referred pain to the radial aspect of the wrist, and local dysfunction. The list of possible local dysfunctions should include De Quervain syndrome, as well as entrapment neuropathy of the superficial radial nerve.

• **CASE DESCRIPTION:** The patient was a 57-year-old man with right radial wrist pain of 6 months' duration. The referral diagnosis was De Quervain syndrome, but a previous course of electrophysical agents-based physical therapy management had been unsuccessful. The physical examination ruled out the cervical, shoulder, elbow, and wrist joints as possible sources of pain. In this case, the diagnosis of entrapment neuropathy of the superficial radial nerve, rather than De Quervain syndrome, was primarily based on the symptom provocation resulting from a modified radial bias upper limb nerve tension test. Based on

this diagnosis, treatment consisted of active and passive exercises using neurodynamic techniques.

• **OUTCOMES:** After 1 treatment session, the patient noted changes with regard to current pain intensity and function that exceeded the minimal clinically important difference and the minimal detectable change, respectively. After only 2 treatment sessions, the patient reported a complete resolution of symptoms and a full return to work.

• **DISCUSSION:** This case report critically evaluates the diagnostic process for patients with radial wrist pain and suggests neuropathy of the superficial sensory branch of the radial nerve as a differential diagnostic option.

• **LEVEL OF EVIDENCE:** Therapy, level 4.
