Paramecia are single-celled aquatic organisms that can survive in a wide range of salinities. However, we need quantitative evidence to show how their osmoregulatory systems adapt to different salt concentrations. I will investigate whether the total solute concentration for osmosis that sustains the paramecia.

Paramecia exposed to hypertonic solutions undergo crenation, becoming shriveled. When introduced to different groups of paramecia in tanks of different salinities, the data shows that their osmoregulatory systems adapt to different levels of osmotic pressure. In each group of paramecia, the total solute concentration (Table 1).

Table 1. Contractile Fluid Output by Paramecia Adapted to Different Salinities

Salinity of Environment (mM NaCl)	Contractile Fluid Output (µL per cell per hour)
0.1	0.1
0.2	0.2
0.3	0.3
0.4	0.4

100. Paramecia from freshwater environments show osmotic pressure changes that correspond to large increases in water intake and water loss. Paramecia from hypertonic salt water environments show that they have adapted to high osmotic pressure with a low water potential. They produce a large amount of contractile fluid to maintain water balance.

Paramecia from a given environment require the movement of large amounts of water to maintain their osmotic pressure. In low salt environments, they are able to maintain their water potential. In high salt environments, they are able to maintain their water potential. Paramecia from a low salt environment show that they are able to maintain their water potential. Paramecia from a high salt environment show that they are able to maintain their water potential.

100. The data shows that the osmotic pressure is approximately halved when the salinity is halved. The data is shown in Table 1.
