The new edition starts with a chapter reviewing key undergraduate concepts in fluid mechanics and thermodynamics introducing the generalized conservation equation for differential and integral analyses It concludes with a self study chapter on computational fluid dynamics CFD of turbulent flows including physics based postprocessing of 3D CFD results and entropy map generation for accurate interpretation and design applications This book includes numerous worked examples and end of chapter problems for student practice It also discusses how to numerically model compressible flow over all Mach numbers in a variable area duct accounting for friction heat transfer rotation internal choking and normal shock formation This book is intended for graduate mechanical and aerospace engineering students taking courses in fluid mechanics and gas dynamics Instructors will be able to utilize a solutions manual for their course

**Nano-Enhanced and Nanostructured Polymer-Based Membranes for Energy Applications** Maria Giovanna Buonomenna, 2022-01-22 There is a growing need for better membranes in several emerging application fields especially those related to energy conversion and storage as well as to water treatment and recycling Processability is an important functional property often ignored especially in the early discovery phase for new materials but it should be one of the most important properties that needs to be considered in the development of better membrane materials Useful membrane materials have to be capable of being formed into thin membranes in particular for membrane gas separation water treatment and desalination and then packaged into large area membrane modules All gas separation membranes that are in current commercial use are based on polymers which are solution processable This book intends to deal with composite in most cases hybrid polymer based membranes for three separate application fields energy conversion energy storage and water treatment and recovery Each chapter will explain clearly the various membrane processes then go on to discuss in detail the corresponding advanced membranes used The logic that lies behind this is that you have to understand the process in order to develop new high performance membranes By taking this approach the author aims to overcome the disconnection that currently exists between membrane materials scientists and industrial process engineers Discusses interdisciplinary content by a single author approaching synthesis and development of materials from the perspective of their processability Describes the novel aspects of membrane science that is related to energy storage conversion and wastewater treatment Presents an emphasis on scientific results which have an impact on real applications in terms of renewable and clean energy challenges
