**Classification** Norman Matloff, 2017-09-19 Statistical Regression and Classification From Linear Models to Machine  
Learning takes an innovative look at the traditional statistical regression course presenting a contemporary treatment in line  
with today's applications and users The text takes a modern look at regression A thorough treatment of classical linear and  
generalized linear models supplemented with introductory material on machine learning methods Since classification is the  
focus of many contemporary applications the book covers this topic in detail especially the multiclass case In view of the  
voluminous nature of many modern datasets there is a chapter on Big Data Has special Mathematical and Computational  
Complements sections at ends of chapters and exercises are partitioned into Data Math and Complements problems  
Instructors can tailor coverage for specific audiences such as majors in Statistics Computer Science or Economics More than  
75 examples using real data The book treats classical regression methods in an innovative contemporary manner Though  
some statistical learning methods are introduced the primary methodology used is linear and generalized linear parametric  
models covering both the Description and Prediction goals of regression methods The author is just as interested in  
Description applications of regression such as measuring the gender wage gap in Silicon Valley as in forecasting tomorrow's  
demand for bike rentals An entire chapter is devoted to measuring such effects including discussion of Simpson's Paradox  
multiple inference and causation issues Similarly there is an entire chapter of parametric model fit making use of both  
residual analysis and assessment via nonparametric analysis Norman Matloff is a professor of computer science at the  
University of California Davis and was a founder of the Statistics Department at that institution His current research focus is  
on recommender systems and applications of regression methods to small area estimation and bias reduction in observational  
studies He is on the editorial boards of the Journal of Statistical Computation and the R Journal An award winning teacher he

**Linear Regression** David J. Olive, 2017-04-18 This text covers both multiple linear regression and some experimental design models The text uses the response plot to visualize the model and to detect outliers does not assume that the error distribution has a known parametric distribution develops prediction intervals that work when the error distribution is unknown suggests bootstrap hypothesis tests that may be useful for inference after variable selection and develops prediction regions and large sample theory for the multivariate linear regression model that has  $m$  response variables A relationship between multivariate prediction regions and confidence regions provides a simple way to bootstrap confidence regions These confidence regions often provide a practical method for testing hypotheses There is also a chapter

on generalized linear models and generalized additive models There are many R functions to produce response and residual plots to simulate prediction intervals and hypothesis tests to detect outliers and to choose response transformations for multiple linear regression or experimental design models This text is for graduates and undergraduates with a strong mathematical background The prerequisites for this text are linear algebra and a calculus based course in statistics
