Linearität in einem System mit Vorverzerrung zu belasten *Practical RF Amplifier Design and Performance Optimization with SPICE and Load- and Source-pull Techniques* Amal Banerjee, 2021-03-01 This book explains and demonstrates with an exhaustive set of design examples how common types of radio frequency RF amplifiers classes A B AB C D E F G and H can be designed and then have their performance characteristics evaluated and optimized with SPICE. The author demonstrates the transient analysis features of SPICE along with industry standard load and source pull techniques to simulate the steady state long term time domain behavior of any test RF amplifier. Describes methods for designing and evaluating optimizing the performance characteristics of an RF amplifier that circumvent the issues involved with existing traditional methods and don't require expensive high end software tools. Includes C language executables for each RF amplifier type eliminating errors that might creep in while computing passive component capacitor inductor resistor values for a given RF amplifier type. Demonstrates industry standard load and source pull schemes that can be included easily in text SPICE netlists allowing accurate calculation of impedance matching and impedance values at the input and output ports of the test RF amplifier eliminating messy error prone S parameter based calculations

Noise Amplifiers for Single and Multiband Applications: A Comprehensive Design Approach Norlaili Mohd Noh, Farshad Eshghabadi, Arjuna Marzuki, 2023-10-11 This book provides comprehensive knowledge aimed at practicing integrated circuit design engineer or researcher to learn and design a low noise amplifier LNA for single and multiband applications. The content is structured in a way so that even a beginner can follow the design method easily. This book features the following characteristics: different types of LNA designs with key building blocks are discussed and detailed analysis is given for each LNA design which covers from the fundamental and principal knowledge to the justification of the design approach. Detailed design approaches are using 180 nm and 130nm CMOS technologies purposely presented in this manner to give exposure to the design of LNA under different technologies. The LNAs in this book are designed for GSM, WCDMA and WLAN standards but the same method can be used for other frequencies of operation. Comprehensive analyses on the extreme or corner condition effects are highlighted. Besides detailed derivation of equations relating to the parameters of the LNA's performance metrics help LNA designers in understanding how the performance metrics of the LNA can be optimized to meet the desired specification. Electromagnetic analyses using Sonnet an electromagnetic tool able to replace the conventional post layout simulation with resistance and capacitance parasitic extraction for more accurate frequency performance prediction are presented. The electromagnetic method is proposed to be used in the LNA design as it can accurately predict the LNA's performance before tape out for first pass fabrication. MATLAB codes are provided to generate important S parameters and noise figure values.

Wide Bandgap Based Devices Farid Medjdoub, 2021-05-26 Emerging wide bandgap WBG semiconductors hold the potential to advance the global industry in the same way that more than 50 years ago the invention of the silicon Si chip enabled the modern computer era. SiC and GaN based devices are starting to become more commercially available. Smaller, faster and more efficient than their counterpart Si based components, these WBG devices also offer greater expected reliability in tougher operating conditions. Furthermore, in this frame a new class of microelectronic grade semiconducting materials that have an even larger bandgap than the previously established wide bandgap semiconductors such as GaN and SiC have been created and are thus referred to as ultra wide bandgap materials. These materials which include AlGaN, AlN, diamond, Ga₂O₃ and BN offer theoretically superior properties including a higher critical breakdown field, higher temperature operation and potentially higher radiation tolerance. These attributes in turn make it possible to use revolutionary new devices for extreme environments such as high efficiency power transistors because of the improved Baliga figure of merit, ultra high voltage pulsed power switches, high efficiency UV LEDs and electronics. This Special Issue aims to collect high quality research papers, short communications and review articles that focus on wide bandgap device design, fabrication and advanced characterization. The Special Issue will also publish selected papers from the 43rd Workshop on Compound Semiconductor Devices and Integrated Circuits held in France WOCSDICE 2019 which brings together scientists and engineers working in the area of III V and other compound semiconductor devices.
