full thickness wounds were created and cultured for up to four weeks in tissue culture In paper I the organisation of a thick neoepidermis was investigated in the in vitro wound healing model when resident cells were provided with a porous suspended three dimensional gelatin scaffold In paper II we investigated the use of a fluorescent staining conventionally used for proliferation studies to facilitate the tracing of transplanted epidermal cells in in vitro wounds in order to improve and expand the use of the model In paper III the model was utilised to investigate the treatment approach of acidification of wounds to evaluate the suitability of such intervention in regards to keratinocyte function and re epithelialisation Studies on re epithelialisation with the aid of the in vitro wound healing model provided insight in neoepidermal structure with porous gelatin scaffolding in the wound a novel methodological approach to tracing cells and response to constrained wound healing environment In paper IV intact human skin was evaluated for modelling the cytotoxic response after exposure to a known irritant compound To study barrier function intact skin was exposed to irritants by restricting exposure topically and full thickness skin in vitro was found suitable for modelling cytotoxicity responses Employing human full thickness skin in vitro makes use of the actual target tissue of interest with epidermal and dermal cells and full barrier function Final Edge

macroscopic and microscopic changes different histological methods and microtechniques can be used as they provide valuable information of the experimental system In addition the observed structural changes allow investigators to set hypothesis for further studies based on one's own observation Thus proper selection and utilization of microtechniques are a must for the success of a research program At present an up to date collection of protocols are not readily available in the literature The latest work in plant microtechniques was published in 1999 by Ruzin but many others are no longer in print e g Jensen 1964 O'Brien and McCully 1981 Furthermore a majority of published works focus on techniques related to general processing and staining procedures A comprehensive treatment that encompasses broader applications of microtechniques to other disciplines is lacking e g archeology wood science etc There is a need to create a comprehensive volume of botanical methods and protocols which includes traditional and novel techniques that can be used by researchers in plant science and investigators in other disciplines that require plant microtechniques in their research and teaching This book covers a wide variety of applications and brings them up to date to make them understandable and relevant especially to students using the methods for the first time It is our intention to create a useful reference for plant histology and related methods that will serve as a foundation for plant scholars researchers and teachers in the plant sciences
