conventional choices relevant to small sites Micro hydro refers to hydropower systems with a power rating of 100kW or less A 100kW system will produce 100 standard units of electricity in one hour These systems have been popular in some sparsely populated or mountainous countries for a number of years but now new technology less stringent regulation of grid connected generators and standardised turbine designs are encouraging more widespread interest in micro hydro in the developed world The renewable energy sector is growing at a remarkable rate and whilst much attention has so far focused on solar and wind technologies Europe and elsewhere have great potential for generating power from small scale hydroelectric installations This book is aimed at site owners designers and consultants who are looking to develop schemes in the micro hydro scale 5 to 100kW although the concepts are applicable to smaller and larger schemes *Power Directory*, 1992 With reference to India *Micro-hydro Design Manual* Adam Harvey, Andy Brown, Priyantha Hettiarachi, Allen Inversin, 1993-01 Micro Hydro Design Manual has grown from Intermediate Technology's field experiences with micro hydro installations and covers operation and maintenance commissioning electrical power induction generators electronic controllers management and energy surveys There is an increasing need in many countries for power supplies to rural areas partly to support industries and partly to provide illumination at night Government authorities are faced with the very high costs of extending electricity grids Often micro hydro provides an economic alternative to the grid This is because independent micro hydro schemes save on the cost of grid transmission lines and because grid extension schemes often have very expensive equipment and staff costs In contrast micro hydro schemes can be designed and built by local staff and smaller organizations following less strict regulations and using off the shelf components or locally made machinery **The Whole Building Handbook** Varis Bokalders, Maria Block, 2010-02-09 The Whole Building Handbook is a compendium of all the issues and strategies that architects need to understand to design and construct sustainable buildings for a sustainable society The authors move beyond the current definition of sustainability in architecture which tends to focus on energy efficiency to include guidance for architecture that promotes social cohesion personal health renewable energy sources water and waste recycling systems permaculture energy conservation and crucially buildings in relation to their place The authors offer a holistic approach to sustainable architecture and authoritative technical advice on How to design and construct healthy buildings through choosing suitable materials healthy service systems and designing a healthy and comfortable indoor climate including solutions for avoiding problems with moisture radon and noise as well as how to facilitate cleaning and maintenance How to design and construct buildings that use resources efficiently where heating and cooling needs and electricity use is minimized and water saving technologies and garbage recycling technologies are used How to close organic waste sewage heat and energy cycles For example how to design a sewage system that recycles nutrients Includes a section on adaptation of buildings to local conditions looking at how a site must be studied with respect to nature climate and community structure as well as human activities The result is a comprehensive thoroughly illustrated

and carefully structured textbook and reference
