Modeling Time in Computing Carlo A. Furia, Dino Mandrioli, Angelo Morzenti, Matteo Rossi, 2012-10-19 Models that include a notion of time are ubiquitous in disciplines such as the natural sciences engineering philosophy and linguistics but in computing the abstractions provided by the traditional models are problematic and the discipline has spawned many novel models This book is a systematic thorough presentation of the results of several decades of research on developing analyzing and applying time models to computing and engineering After an opening motivation introducing the topics structure and goals the authors introduce the notions of formalism and model in general terms along with some of their fundamental classification criteria In doing so they present the fundamentals of propositional and predicate logic and essential issues that arise when modeling time across all types of system Part I is a summary of the models that are traditional in engineering and the natural sciences including fundamental computer science dynamical systems and control theory hardware design and software algorithmic and complexity analysis Part II covers advanced and specialized formalisms dealing with time modeling in heterogeneous software intensive systems formalisms that share finite state machines as common ancestors Petri nets in many variants notations based on mathematical logic such as temporal logic process algebras and dual language approaches combining two notations with different characteristics to model and verify complex systems e g model checking frameworks Finally the book concludes with summarizing remarks and hints towards future developments and open challenges The presentation uses a rigorous yet not overly technical style appropriate for readers with heterogeneous backgrounds and each chapter is supplemented with detailed bibliographic remarks and carefully chosen exercises of varying difficulty and scope The book is aimed at graduate students and researchers in computer science while researchers and practitioners in other scientific and engineering disciplines interested in time modeling with a computational flavor will also find the book of value and the comparative and conceptual approach makes this a valuable introduction for non experts The authors assume a basic knowledge of calculus probability theory algorithms and programming while a more

advanced knowledge of automata formal languages and mathematical logic is useful From scientific instrument to industrial machine Richard Doornbos, Sijr van Loo, 2012-04-28 Architectural stress is the inability of a system design to respond to new market demands It is an important yet often concealed issue in high tech systems In From scientific instrument to industrial machine we look at the phenomenon of architectural stress in embedded systems in the context of a transmission electron microscope system built by FEI Company Traditionally transmission electron microscopes are manually operated scientific instruments but they also have enormous potential for use in industrial applications However this new market has quite different characteristics There are strong demands for cost effective analysis accurate and precise measurements and ease of use These demands can be translated into new system qualities e g reliability predictability and high throughput as well as new functions e g automation of electron microscopic analyses automated focusing and positioning functions From scientific instrument to industrial machine takes a pragmatic approach to the problem of architectural stress In particular it describes the outcomes of the Condor project a joint endeavour by a consortium of industrial and academic partners In this collaboration an integrated approach was essential to successfully combine various scientific results and show the first steps towards a new direction System modelling and prototyping were the key techniques to develop better understanding and innovative solutions to the problems associated with architectural stress From scientific instruments to industrial machine is targeted mainly at industrial practitioners in particular system architects and engineers working on high tech systems It can therefore be read without particular knowledge of electron microscope systems or microscopic applications The book forms a bridge between academic and applied science and high tech industrial practice By showing the approaches and solutions developed for the electron microscope it is hoped that system designers will gain some insights in how to deal with architectural stress in similar challenges in the high tech industry **Digital Systems:**
