

Basic UV-Vis Theory, Concepts and Applications

Introduction

Ultraviolet and visible spectrometers have been in general use for the last 35 years and over this period have become the most important analytical instrument in the modern day laboratory. In many applications other techniques could be employed but none rival UV-Visible spectrometry for its simplicity, versatility, speed, accuracy and cost-effectiveness.

This description outlines the basic principles for those new to UV-Visible spectrometry. It is intended purely as a brief introduction to the technique and it is Thermo Spectronic's policy to continually add to this range of documentation for further details, as they become available.

Definitions and Units

Radiation is a form of energy and we are constantly reminded of its presence via our sense of sight and ability to feel radiant heat. It may be considered in terms of a wave motion where the wavelength, λ , is the distance between two successive peaks. The frequency, ν , is the number of peaks passing a given point per second. These terms are related so that:

$$c = \nu\lambda$$

where c is the velocity of light in a vacuum.

Figure 1 The wavelength λ of electromagnetic radiation

The full electromagnetic radiation spectrum is continuous and each region merges slowly into the next. For spectroscopy purposes, we choose to characterize light in the ultraviolet and visible regions in terms of wavelength expressed in nanometers. Other units which may be encountered, but whose use is now discouraged, are the Angstrom (\AA) and the millimicron ($\text{m}\mu$).

$$1\text{nm} = 1\text{m}\mu = 10\text{\AA} = 10^{-9}\text{ meters}$$

UV-VIS Spectroscopy and Its Applications Heinz-Helmut Perkampus,2013-03-08 UV VIS spectroscopy is one of the oldest methods in molecular spectroscopy The definitive formulation of the Bouguer Lambert Beer law in 1852 created the basis for the quantitative evaluation of absorption measurements at an early date This led firstly to colorimetry then to photometry and finally to spectrophotometry This evolution ran parallel with the development of detectors for measuring light intensities i e from the human eye via the photo element and photocell to the photomultiplier and from the photo graphic plate to the present silicon diode detector both of which allow simultaneous measurement of the complete spectrum With the development of quantum chemistry increasing atten tion was paid to the correlation between light absorption and the structure of matter with the result that in recent decades a number of excellent discussions of the theory of electronic spectroscopy UV VIS and luminescence sp ctroscopy have been published Consequently this extremely interesting aspect of molecular spec troscopy has dominated the teaching of the subject both in my own lectures and those of others However it is often overlooked that in addition to the theory applications of spectroscopic methods are of particular interest to scientists For this reason a lecture series about electronic spectroscopy given in the Institute for Physical Chemistry at the Heinrich Heine University in Dusseldorf was supplemented by one about UV VIS spectroscopy and its applications This formed the basis of the present book [Spectroscopic Methods](#) Mr. Rohit Manglik,2024-05-18 EduGorilla
