ABSTRACT: An Actuator is basically a position servo control system used in industries and vehicles. A rotary electro mechanical actuation system is an angular positioning system used in aerospace applications such as control of rudder and ailerons of aero planes and control of control surfaces, jet vanes, etc. This position loop system is to steer the vehicle to move in required direction. A servo controller is a driver to accurately control the position of the actuation system by getting the command signals from the on-board computer of the vehicle. It involves a class of DSP controller optimized for digital motor motion control and power conversion applications. In this thesis, Closed loop Rotary Electro Mechanical Actuating system is designed for the derived specifications by using the CAD software UNIGRAPHICS, and simulated the design with the help of FEA software ANSYS and MATLAB.

KEYWORDS: Actuator, ANSYS, CAD, DSP controller, UNIGRAPHICS.

1. INTRODUCTION

This document covers the description, design, inputs and specifications of the Actuation System for aerodynamic control of an Aero-vehicle. The document also describes the actuator specifications, mechanical components, BLDC motor, position sensor and the control system including simulation.

1.1 Actuator

An actuator is a mechanism that converts energy into motion. It can also be used to apply a force. An actuator typically is a mechanical device that takes energy, usually created by air, electricity, or liquid, and converts that into some kind of motion. That motion can be anything from blocking to clamping to ejecting. Actuators are typically used in manufacturing or industrial applications and may be used in things like motors, pumps, switches, and valves. The most common type of actuator is powered by air — the pneumatic cylinder, also known as the air cylinder. Air cylinders are air-tight cylinders, typically made from metal, that use the energy of compressed air to move a piston. Air cylinders are most commonly used in manufacturing and assembly processes. Grippers, which are used in robotics, use actuators driven by compressed air to work much like human fingers. Actuators can also be powered by electricity or hydraulics. Much like there are air cylinders, there are also electric cylinders and hydraulic cylinders where the cylinder converts electricity or hydraulics into motion. Hydraulic cylinders are often used in certain types of vehicles.

Many actuators have more than one type of power source. Solenoid valves, for example, can be powered by air and electricity. Electricity powers the solenoid, and the solenoid, powered by air actuates the valve. Alternatively, the solenoid can be powered by hydraulics and electricity. Actuators can create a linear motion, rotary motion, or oscillatory motion. That is, they can create motion in one direction, in a circular motion, or in opposite directions at regular intervals. Hydraulic and air cylinders can be classified as single acting, meaning that the energy source causes movement in one direction and a spring is used for the other direction. Alternatively, these cylinders can be double acting cylinders, meaning the energy is used in two directions. While actuators are typically discussed in terms of mechanical implements, muscles are sometimes given as an example of an actuator. Energy (e.g., created by eating carbohydrates) is converted by the muscle (i.e., the actuator) into motion (e.g., kicking a ball).

Allen, 2005-07-08 It is challenging at best to find a resource that provides the breadth of information necessary to develop a successful micro electro mechanical system. MEMS design. *Micro Electro Mechanical System Design* is that resource. It is a comprehensive single source guide that explains the design process by illustrating the full range of issues involved, how they are interrelated, and how they can be quickly and accurately addressed. The materials are presented in logical order relative to the manner a MEMS designer needs to apply them. For example, in order for a project to be completed correctly on time and within budget, the following diverse yet correlated issues must be attended to during the initial stages of design and development: Understanding the fabrication technologies that are available; Recognizing the relevant physics involved for micron scale devices; Considering implementation issues applicable to computer aided design; Focusing on the engineering details and the subsequent evaluation testing; Maintaining an eye for detail regarding both reliability and packaging. These issues are fully addressed in this book along with questions and problems at the end of each chapter that promote review and further contemplation of each topic. In addition, the appendices offer information that complement each stage of project design and development. **Electromechanical Systems** Cornelius T. This technology can be used in a very broad range of applications from robotics and automation to the biomedical field. The need for improved transducer performance has

resulted in considerable efforts towards the development of devices relying on materials with intrinsic transduction properties. These materials, often termed as smart or intelligent, include improved piezoelectrics and magnetostrictive or shape memory materials. Emerging electromechanical transduction technologies based on so-called ElectroActive Polymers (EAP) have gained considerable attention. EAP offer the potential for performance exceeding other smart materials while retaining the cost and versatility inherent to polymer materials. Within the EAP family, dielectric elastomers are of particular interest as they show good overall performance, simplicity of structure, and robustness. Dielectric elastomer transducers are rapidly emerging as high performance pseudo muscular actuators useful for different kinds of tasks. Further, in addition to actuation, dielectric elastomers have also been shown to offer unique possibilities for improved generator and sensing devices. Dielectric elastomer transduction is enabling an enormous range of new applications that were precluded to any other EAP or smart material technology until recently. This book provides a comprehensive and updated insight into dielectric elastomer transduction, covering all its fundamental aspects. The book deals with transduction principles, basic materials properties, design of efficient device architectures, material and device modelling, along with applications. Concise and comprehensive treatment for practitioners and academics. Guides the reader through the latest developments in electroactive polymer based technology. Designed for ease of use, with sections on fundamentals, materials, devices, models, and applications. **Advances**

Im Mittelpunkt der Arbeit stand die Entwicklung piezoelektrisch angetriebener Mikrospiegel. Dabei handelt es sich um miniaturisierte optische Bauteile zur Ablenkung von Laserstrahlen mit denen sich z. B. Bildprojektionen realisieren lassen. Die Arbeit umfasst die Design und Technologieentwicklung derartiger Mikrospiegel sowie die Entwicklung von Sensoren zur Spiegelpositionserfassung. Zudem bildet die eingehende Charakterisierung einen weiteren Schwerpunkt dieser Arbeit. Insgesamt wurden 30 verschiedene 1D Spiegel, elf verschiedene 2D Spiegel sowie drei unterschiedliche Sensor Typen entworfen, hergestellt und untersucht. Für die resonanten 1D Spiegel stellen die erreichbaren Scanwinkel und Resonanzfrequenzen die charakteristischen Größen dar. Die hier hervorgegangenen 1D Spiegel erreichen sehr große Scanwinkel von 106° und hohe Resonanzfrequenzen von 69 kHz. Bei den 2D Spiegeln sind die Kombinationen verschiedener Spiegelbewegungsmoden für die Realisierung unterschiedlicher Laserstrahl Trajektorien von großer Bedeutung. Dabei wurden zwei Designkonzepte für die 2D Spiegel realisiert: Die sogenannten Quadpod Designs und die kardanisch aufgehängten Spiegel. Die Quadpod Spiegel realisieren zwei senkrechte Torsionsmoden, die nahestehende Eigenfrequenzen aufweisen. Somit lassen sich kreisförmige und rechteckige Ausleuchtungen durch die resultierenden Lissajous Figuren erzeugen. Zusätzlich sind derartige Spiegel auch für Translationsbewegungen geeignet. An einem Spiegeltyp mit 7 mm Spiegeldurchmesser wurden translatorische Amplituden von bis zu 1600 µm nachgewiesen, welche zu den höchsten vertikalen Amplituden von Spiegeln gehören. Die kardanisch aufgehängten 2D Spiegel erlauben quasi statisch und resonant angetriebene Torsionsbewegungen und somit die Realisierung eines kompletten integrierten Rasterscanners. Die resonanten 1D und 2D Spiegel erfordern die Regelung zum Adressieren projizierter Punkte. Dafür wurden unterschiedliche Messprinzipien untersucht. Die kapazitiven und piezoelektrischen PZT Sensoren zeigen die besten Signalqualitäten für die Positionserfassung dynamischer Bewegungen und können Messauflösung von mehr als 12 Bit erreichen. Statische Positionen des Spiegels lassen sich dagegen gut mit metallischen DMS erfassen. Auch wenn noch viele Herausforderungen und Aufgaben zu bewältigen sind, veranschaulichen die Ergebnisse der Arbeit das Potential piezoelektrischer Spiegel in der nahen Zukunft in kommerziellen Produkten.
