OBJECTIVE — To examine the cross-cultural validity of the Problem Areas in Diabetes Scale (PAID) in Dutch and U.S. diabetic patients.

RESEARCH DESIGN AND METHODS — A total of 1,472 Dutch people with diabetes completed the PAID along with other self-report measures of affect. Statistics covered Cronbach's α , exploratory factor analysis (EFA), and confirmatory factor analysis (CFA), Pearson's product-moment correlation, and *t* tests. Psychometric properties of PAID were compared for Dutch and U.S. diabetic patients.

RESULTS — Internal consistency of the Dutch PAID was high and stable across sex and type of diabetes. Test-retest reliability was high. Principal component analyses confirmed 1 general 20-item factor, whereas EFA identified 4 new subdimensions: negative emotions, treatment problems, food-related problems, and lack of social support. These dimensions were confirmed with CFA and were replicated in the U.S. sample. The PAID and its subscales demonstrated moderate to high associations in the expected direction with other measures of affect. Dutch and U.S. subjects reported having the same problem areas, with U.S. patients reporting higher emotional distress levels both in type 1 and type 2 diabetes.

CONCLUSIONS — The Dutch and U.S. 20-item PAID appeared to be psychometrically equivalent, which allowed for cross-cultural comparisons.

Diabetes Care 23:1305–1309, 2000

Diabetes is a demanding disease with a major effect on the quality of life of patients and their families (1,2). Research has suggested that psychological distress frequently occurs in people with diabetes and is often related to difficulties in coping with the daily regimen and worries about developing late complications (3,4). Psychological distress is not only burdensome itself, but also it can impede the self-care behaviors of the patients, thereby

compromising glycemic control (5–7). To quantify levels of emotional distress in people with diabetes, various measures have been developed in the U.K., Germany, Canada, and U.S. (8–11). As Glasgow et al. (12) recently showed, research must establish the relative strengths and weaknesses of the various diabetes-specific instruments, particularly their sensitivity to detect changes and intervention effects (12). We further emphasize the importance of cross-

cultural validation of such questionnaires. Psychosocial research in diabetes could benefit significantly from standardization of instruments to allow for international comparison of results (13).

The Problem Areas in Diabetes Scale (PAID) is a brief self-report measure of diabetes-related distress that has been found to be valid and clinically useful in U.S. type 1 and type 2 diabetic patients (14–16). PAID scores have been found to show positive associations with HbA_{1c} and are a major predictor of poor adherence to treatment not involving general emotional distress. The PAID seems to be a good candidate for the measurement of diabetes-related distress across countries, but its cross-cultural validity has yet to be established. Ishii et al. (17) found evidence to support the clinical utility of a Japanese version of the PAID in a sample of predominantly type 2 diabetic patients. In this article, we report on the validation of the Dutch version of the PAID by comparing PAID scores across samples of Dutch and U.S. diabetic patients.

RESEARCH DESIGN AND METHODS

Subjects

As part of a large survey (18), 3,000 randomly selected patients of the 40,000 members of the Dutch Diabetes Association were mailed a booklet of self-report questionnaires, including the PAID. To determine test-retest reliability, a random sample of 250 patients from the total group was invited for a second assessment ~2 months later. PAID data from a U.S. sample of 256 type 1 and type 2 diabetic patients at the Joslin Diabetes Center (Boston, MA) (15) were reanalyzed and compared with the Dutch sample.

Measures

Self-reported demographic and clinical characteristics of the subjects included age, sex, marital status, monthly income, years of education, age at onset of diabetes, treatment regimen, number of complications, most recent HbA_{1c} level, comorbidity, fre-

Diabetes Related Emotional Distress In Dutch And U S:

Psychodiabetologie Frank Petrak, Stephan Herpertz, 2013-09-18 Die Diagnose Diabetes mellitus hat weitreichende Konsequenzen für das Leben der Betroffenen. Nicht nur der bisherige Alltag ganz erheblich, sondern auch das Essverhalten und Blutzuckerkontrollen bestimmen nun das Leben. Sondern auch viele psychosoziale Aspekte erhalten eine ganz andere Gewichtung. Was bedeutet die Diagnose zum Beispiel für Kinder und ihren weiteren Lebensweg? Was wenn es irgendwann zum Diabetes Burnout kommt oder wenn eine Depression entsteht? Wie gehen die Patienten mit dem Alterwerden und der Bedrohung durch Spätschäden um? In diesem Buch beschreiben sich die Autoren umfassend mit dieser Problematik. Neben den medizinischen Grundlagen liegt der Schwerpunkt auf den psychischen und psychosozialen Aspekten der Erkrankung. Ergänzend werden umfassende Online-Materialien zur Verfügung gestellt, die für Ärzte, Diabetesberater und Psychotherapeuten eine praxisnahe Unterstützung der Behandlung darstellen. *Depressive Störungen bei Diabetes mellitus*

Andreas Schmitt, 2015-06-01 Internationale Befunde weisen darauf hin, dass depressive Symptome und Störungen bei Menschen mit Diabetes mellitus häufig vorkommen. Diese gesteigerte Depressionsprävalenz lässt sich vermutlich durch diabetesspezifische Belastungsfaktoren erklären, welche sich auf die psychische Gesundheit von Menschen mit Diabetes negativ auswirken. Darüber hinaus werden depressive Störungen bei Diabetes als besonders ungünstige Komorbidität betrachtet, da vermutlich negative psychologische und somatische Wechselwirkungen bestehen, welche in einer schlechteren Prognose des Diabetes hinsichtlich diabetischer Folgekrankheiten sowie der Lebenserwartung resultieren. Da die aktuelle Befundlage allerdings überwiegend dem englischsprachigen Kulturraum entstammt und ihre Generalisierbarkeit auf Deutschland bislang nicht gesichert ist, werden im Rahmen dieser Arbeit Prävalenzen diabetesspezifischer Risikofaktoren sowie negative Auswirkungen depressiver Störungen bei deutschen Personen mit Diabetes anhand umfangreicher Stichproben aus der tertiären Patientenversorgung untersucht. **Mental Health, Diabetes and Endocrinology**

Anne M. Doherty, Aoife M. Egan, Sean Dinneen, 2021-10-28 Mental Health Diabetes and Endocrinology examines key areas of clinical overlap between endocrinology and mental health. Written for clinicians, it draws together developments from literature and clinical practice with a focus on clinical conundrums and treatment challenges which arise across endocrinology, psychiatry, psychology and primary care. *Screening for Depression and Other Psychological Problems in Diabetes*

Cathy E. Lloyd, Frans Pouwer, Norbert Hermanns, 2012-08-12 This book is divided into two main sections and covers a broad range of issues important for health practitioners to be aware of when caring for people with comorbid diabetes and depression. Section One of the book contains the overall ideas and the more recent developments in measuring psychological morbidity in people with diabetes. When attempting to identify people with depression or other psychological problems, it is important for practitioners to recognize the limitations of screening as well as its utility. Issues such as the basic principles regarding when and when not to screen, the cultural applicability of tools, different questionnaire formats and key concepts such as

sensitivity and specificity of tools and their positive and negative predictive value will be considered. In particular, there has been increased interest in the concept of diabetes-related distress and several tools have been developed to measure this. There are broad-based measures of distress such as the Problem Areas in Diabetes PAID scale, the Diabetes Adjustment Scale DAS, The Diabetes Health Profile, The Fear of Hypoglycemia Scale, etc. There are also a range of generic quality of life tools which have been used effectively in people with diabetes, for example the Medical Outcomes Survey Short Forms SF36, SF12, the World Health Organisation Well-being questionnaire WHO-5 and the EQ5-D. These tools are important because they measure aspects of psychological well-being that are specifically associated with the experience of having a long-term condition and so have important implications for both self-care and health-care practice. The potential overlap of symptoms of depression and symptoms of diabetes-related distress are considered in this section and the implications for practice discussed. Section Two covers the most commonly used tools that have been used to screen for depression. For each tool considered, some information which is easily referred to by the reader is set out in a table which includes details of the author, time of first use, country where it was first developed, some examples of the questions used, the languages it is available in, data on sensitivity and specificity. Each instrument will then be discussed in terms of its use in research as well as practice and its applicability in different patient groups, different cultural settings and so on. Guidance on the practical use of each tool is included and the most popular depression screening tools are focussed on.

Diagnostische Verfahren in der Rehabilitation Jürgen Bengel, Markus Wirtz, Christian Zwingmann, 2008-01-16. Der Band bietet eine umfassende Sammlung diagnostischer Verfahren im Bereich der Rehabilitation. Es werden sowohl krankheitsbergreifende Verfahren als auch Verfahren für ausgewählte Indikationsgebiete dargestellt. Nach einer Einführung, die einen systematischen Überblick über den Stellenwert psychologischer Diagnostik in der Rehabilitation liefert, wird in einem Beitrag auf die International Classification of Functioning (ICF) eingegangen. Anschließend beschreibt der erste Teil des Bandes krankheitsbergreifende Verfahren, die u.a. folgende Bereiche umfassen: Lebensqualität und Funktionszustand, Gesundheitsökonomisch orientiertes Assessment von Lebensqualität, Soziale Unterstützung, Rehabilitation und Behandlungszufriedenheit. Im zweiten Teil werden ausgewählte Verfahren für die Indikationsgebiete Dermatologie, Diabetes, Gastroenterologie, Kardiologie, Onkologie, Orthopädie, Rheumatologie und Pneumologie vorgestellt. Verfahren, die im Rahmen der sozialmedizinischen Begutachtung zum Einsatz kommen können, runden den Band ab. Die Einheitlichkeit der Verfahrensbeschreibungen ermöglicht einen schnellen Zugang zu den wichtigsten Informationen. Angaben zum Anwendungsbereich und technischen Aspekten wie etwa Bearbeitungszeit und Auswertungsmethodik liefern wichtige Hinweise zum praktischen Einsatz der Verfahren.
