The Drama of DNA Karen H. Rothenberg, Lynn W. Bush, 2014

Through the use of dramatic narratives *The Drama of DNA* brings to life the complexities raised by the application of genomic technologies to health care and diagnosis. This creative pedagogical approach shines a unique light on the ethical, psychosocial and policy challenges that emerge as comprehensive sequencing of the human genome transitions from research to clinical medicine. Narrative genomics aims to enhance understanding of how we evaluate process and share genomic information and to cultivate a deeper appreciation for difficult decisions encountered by health care professionals, bioethicists, families and society as this technology reaches the bedside. This innovative book includes both original genomic plays and theatrical excerpts that illuminate the implications of genomic information and emerging technologies for physicians, scientists, counselors, patients, blood relatives and society. In addition to the plays, the authors provide an analytical foundation to frame the many challenges that often arise.

Stark, this popular manual has been fully updated to reflect recent advances in the field, providing NICU physicians, neonatal/perinatal fellows, residents and neonatal nurse practitioners with quick access to key clinical information.

Critical paediatric bioethics and the treatment of short stature Maria Cristina Murano, 2019-03-27. Several studies have argued that there is a correlation between short stature and negative experiences and characteristics such as social discrimination, economic disadvantage, health problems, especially for men. The idea that short men have a disadvantage in social interactions and in partner choices is also widespread in popular culture and common knowledge. It is now possible to use recombinant human growth hormone (hGH) to treat children with idiopathic short stature (ISS), namely children who are shorter than average for unknown medical reasons. Critics argue that there is a lack of evidence of both psychological distress caused by short stature and the efficacy of the treatment in increasing children's well-being. This controversy is reflected in international drug evaluations, while the Food and Drug Administration (FDA) in the US granted marketing authorisation for hGH for children with ISS in 2003, the European Medicines Agency (EMA) refused it in 2007. The research presented here had two aims: first, to identify and analyse the norms, values and assumptions about short stature and the use of hGH treatment for children with ISS found within sociocultural, philosophical and regulatory discussions of these and within narrated lived experiences of short stature. Second, to critically and reflectively discuss how these analyses contribute to bioethical debates on the use of hGH treatment for children with ISS. It employs what it calls a critical paediatric bioethics theoretical approach, which deems as important to carefully analyse different reasoning, conceptualisations and arguments around the object of study through a self-reflective analysis that is also sceptical about other forms of problematisation and that combines philosophical analyses while being

open to social implications and drawing upon empirical methods The first article proposes a critical understanding of medicalisation as both a concept and a phenomenon and explores what insights such critical understanding brings to ethical discussions about hGH for ISS It argues that three main ethical issues concern the medicalisation of short stature the downplayed role of the qualitative dimension of short stature the justification of the treatment as sometimes based on uncritically assumed social beliefs and unrealistic parental expectations and possible misconduct of stakeholders The second article examines the arguments for and against granting marketing authorisation of hGH treatment for the indication of ISS presented in selected FDA and EMA documents It combines argumentative analysis with an approach to policy analysis called what s the problem represented to be and focuses on underlying assumptions and presuppositions about short stature and hGH treatment for ISS It then discusses these arguments through the relational experiential and cultural understandings of disability and argues that the choice about whether to give hGH is not merely a choice based on efficacy and safety but requires an examination of the values that we transmit by that choice The third article examines how and why attendance to lived experiences of height is needed in bioethical and biomedical discussions of hGH treatment for children with ISS It first describes what it defines as the problem oriented approach to the debate about hGH treatment for children with ISS It then offers a sociophenomenological analysis of whether and if so when and how height matters to the interviewed people in the Netherlands who are shorter than average without any known medical reasons The sociophenomenological analysis shows the richness of meanings of lived experiences of short stature that cannot be captured by the problem oriented approach and suggests complementing clinical practices with narrative approaches This research contributes to the ethical debate about using hGH for children with ISS setting a critical gaze onto the social perception of short stature highlighting some ethical challenges met by stakeholders involved at different levels such as families medical professionals and policy makers and providing new insights into how to address these ethical issues It is therefore of interest to stakeholders bioethicists and lay people willing to explore alternative ways to address such bioethical dilemmas and other paediatric interventions that aim to normalise children s bodily characteristics
