computational models and the reduction of energy consumption to help improve FPGA performance are given in detail. Written from a system level design perspective and with a DSP focus, the authors present many practical application examples of complex DSP implementation involving high performance computing, e.g. matrix operations such as matrix multiplication, high speed filtering including finite impulse response (FIR) filters and wave digital filters (WDFs), adaptive filtering, e.g. recursive least squares (RLS) filtering, transforms such as the fast Fourier transform (FFT). FPGA based Implementation of Signal Processing Systems is an important reference for practising engineers and researchers working on the design and development of DSP systems for radio telecommunication, information audio visual and security applications. Senior level electrical and computer engineering graduates taking courses in signal processing or digital signal processing shall also find this volume of interest.
