Pragadeesh,Sanguida A,Prathima G S , Primary teeth are natural space maintainers which should be preserved till their
physiological exfoliation Pulpectomy is a conservative treatment option to salvage infected primary teeth However primary
teeth with their bizarre root canals that undergo continued secondary dentin deposition and physiological root resorption
combined with pathological changes present a significant endodontic challenge especially during obturation The obturation
technique used should ensure a hermetic seal and at the same time prevent extrusion of the obturation material which would
be detrimental to the successor teeth This book discusses various obturation techniques for primary teeth root canals and
summarize the evidence It was found that various factors like obturation material used location of teeth in the oral cavity
canal anatomy handling characteristics cost and treatment time play an important role in the clinician s choice of obturation
technique Therefore there is no single technique that can be recommended as ideal for obturation **Güncel Restoratif**
