

## CHINCOL LABORATORY TESTS - REFERENCE VALUES

This table lists reference ranges (expressed in both SI units and traditional units) for the most common laboratory tests and is intended for interpretation of the results as they are provided in the examinations. Most of the values apply to adults and where they differ for children it will be indicated. Many important laboratory reference values are not listed here, because of the less frequent use of these tests. Such values are inserted parenthetically following the results recorded in the examination section.

critical safety information     Circulating levels and assessment of clinical laboratory analytes, in >80-year-old, apparently healthy, moderately healthy, and frail individuals Maria Edvardsson, 2019-09-09 Blood samples are often used to investigate the possible presence of disease and to make treatment decisions In the interpretation of the results comparison either with previous values from the same individual or with a set of appropriate group based reference intervals are used Current reference intervals for common laboratory analytes are often based on measurements from apparently healthy persons aged 18-65 years Age is accompanied by a general decline in organ functions and it is difficult to determine whether a change in levels of laboratory analytes in an elderly individual can be attributed to age alone independent of environmental or disease processes Frailty can be seen as a consequence of age related multifactorial deterioration physical cognitive and sensory resulting in vulnerability and lack of adaptability to internal stressors such as infection or new medication and/or external stressors such as fall at home Consensus about the definition of frail and frailty is missing both nationally and internationally the question arises whether different definitions of frailty affect the interpretation of analytes when comparing different groups of elderly The overarching aim of the thesis was to interpret and assess circulating levels of some clinical laboratory analytes in relation to conventional reference values in 80 year old apparently healthy moderately healthy and frail individuals Data originated from other studies in which blood samples were collected from individuals 80 year old Comparisons in Paper I of levels of some laboratory analytes from 138 nursing home residents NHRs was made with blood from reference populations both blood donor and the NORIP study The results indicated differences for some immunological complement factor 3 and 4 immunoglobulin G and M and chemical analytes alanine aminotransferase ALT phosphate albumin sodium creatinine and urea but no differences in levels occurred for aspartate aminotransferase AST gamma glutamyltransferase GT or lactate dehydrogenase LDH It was unclear whether the differences were due to differences in age between the elderly and the reference populations or whether the elderly individuals had chronic diseases and were on medication In Paper II 569 individuals elderly individuals 80 years old were classified as healthy moderately healthy and frail based on diseases medications and physical and cognitive abilities Statistical differences between the groups were found for the investigated analytes albumin ALT AST creatinine and GT In Paper IV individuals from Paper II n=569 were divided into two groups and thereafter divided into apparently healthy moderately healthy and frail One group was subdivided into apparently healthy moderately healthy and frail based on physical and cognitive abilities and the other group was divided based on the frailty index FI There was no statistical difference found between apparently healthy and moderately healthy groups regardless of classification model used Among frail individuals differences in levels occurred for three out of the five investigated analytes ALT creatinine and g GT with lower levels occurring when the FI classification model was used No differences in levels occurred for albumin or AST in frail individuals regardless of classification model used The aim of Paper III was to study whether 1 year changes in complete blood count CBC including haemoglobin Hb red blood cell RBC
