Entwurf und Konstruktion einer vertikal laufenden Windturbine nach dem Widerstandsprinzip unter Nutzung der aerodynamischen Eigenschaften eines Flügelprofils Sarmadi, Mohammad-Ali, 2018-12-19 Die umweltfreundlichen und geruscharmen vertikalen Windenergieanlagen die nach dem Widerstandsprinzip arbeiten erzeugen ein hohes Drehmoment und sind windrichtungsunabhängig Trotz dieser Vorteile haben sie niedrige Drehzahlen und ihre Gestalt ist massiv so dass sie in der Höhe nicht für große Produktionen eingesetzt werden können Gerade diese Nachteile haben es bis jetzt verhindert dass solche Anlagen für die Stromproduktion weitläufig eingesetzt werden Durch diese Arbeit wurden zuerst die Funktionen von Vertikalanlagen insbesondere die Rotation um die Vertikalachse untersucht Die Kräfte die durch Wind gewonnen werden können wurden in der Beziehung mit der Windgeschwindigkeit und daraus resultierender Umdrehungsgeschwindigkeit beobachtet Es wurde festgestellt dass sich die Flügel wenn sie sich in der Windrichtung bewegen an der Erzeugung des Drehmoments beteiligen und wenn sie sich gegen den Wind bewegen als Bremse wirken und einen negativen Einfluss auf die resultierenden Drehmomente haben Mit Hilfe einer Direkt Kupplung von einem Vielpol Vertikal Permanentmagnet Synchrongenerator konnte trotz niedriger Drehzahlen ein dreiphasiger Strom produziert werden Der Einsatz des Generators im Turm und der Ausfall von schwerem Getriebe sowie eine neue Rotorkonstruktion ermöglichen den Einsatz der Anlage in der Höhe Basierend auf den Informationen wurde eine vertikale Windenergieanlage nach dem Widerstandsprinzip entworfen konstruiert und realisiert die drei frei um die Verbindungsachse drehende Flügelpaare besitzt die um 120° gegeneinander versetzt eingesetzt sind Die frei beweglichen Flügel haben eine NACA Profilform und wegen ihres aerodynamischen Charakters erzeugen sie im Bremszustand die geringsten Widerstände Dagegen können sie wenn sie senkrecht in der fordernden Position zum Wind stehen beachtliche Drehmomente erzeugen Die drei Flügelpaare bewirken eine gleichförmige Rotation der Vertikalwelle Die Entwicklung von Formeln für die Pendelbewegungen des Flügelpaares um die Verbindungsachse und die Rotation des gesamten Rotors um die Vertikalachse haben geholfen die Parameter die bei der Energiegewinnung eine Rolle spielen zu ermitteln und ihre Änderungen zu

beurteilen Es wurde ebenfalls untersucht wie die Funktion der Anlage verbessert werden könnte Die Pendelbewegungen der frei beweglichen Flügelpaare die durch Wind eingestellt werden wurden mit Hilfe der Verschiebung des Flügeldrehpunktes optimiert Außerdem wurde untersucht welche Wirkung die Dicke des Flügelprofils auf die Rotation um die Verbindungsachse erzielt Des Weiteren wurde ein Prüfstand aufgebaut und das Drehmoment des Generators durch Drehmomentaufnehmer am Prüfstand getrennt aufgenommen und seine Drehmoment Drehzahl Kennlinie gezeichnet Die mechanische Leistung des Rotors wurde durch einige Parameter wie Windgeschwindigkeit Drehzahl Widerstandsbeiwert Pendelwinkel und Rotationswinkel bestimmt Die Leistung des Generators wurde im Windkanal durch Vermessung der Spannungen und Ströme der Verbraucher Widerstände die an seinem Ausgang angeschlossen sind ermittelt Der resultierende Wirkungsgrad scheint mit dem Einsatz dieses neuen Konzepts im Vergleich zu anderen Vertikalanlagen gering zu sein Er könnte durch die Auswahl dünnerer Profile und den Einsatz geeigneter Generatoren wie noch gezeigt wird verbessert werden The environmentally friendly and Low noise vertical axis wind turbines VAWTs which work based on the Drag Force have the advantages such as producing a good torque and independency of wind direction and do not need to track the wind Despite these advantages they suffer from low rotational speed and huge massive shape so they cannot be installed in high altitudes for large scale productions These disadvantages made them have a small share in electrical energy production Through this work technical performance of vertical axis wind turbines especially rotation around the vertical axis was first examined Then the forces which can be obtained from wind were observed compared to the wind speed and the resulting rotational speed It was noted that the wings when moving in the same direction with wind participate in torque generation and when moving in the opposite direction of wind make a brake and reduce the resulting torque In spite of low rotational speed of VAWT a three phase current could be produced by direct coupling of a vertically multipolar permanent magnet synchronous generator Establishment and using the system in suitable height could be feasible by placing the generator in the tower new rotor construction and eliminating heavy gearbox According to the above mentioned information a vertical axis wind turbine has been designed constructed and implemented based on the Drag Force The turbine has three pairs of wings rotating freely around the connecting axis which are inserted offset by 120 and each pair consists of two orthogonal blades The free flowing wings have NACA profile shape and because of their aerodynamic character they produce minimum resistance in braking condition On the other hand when they reach to the state of torque producing position they can produce considerable torque The three pairs of wings cause a uniform rotation of the vertical shaft The developed formulas for describing pendulum motion of wing pairs around the connecting axis and rotation of the entire rotor around the vertical axis have helped to find the parameters that play role in energy generation and to assess their changes It was also investigated which device functions could be improved and for this purpose pendulum motion of the free moving pairs of wings which are adjusted by wind has been optimized with the help of displacing the wings rotation points The effect of thickness of the wings on their

rotation was also investigated Furthermore a test rig was built and torque of the generator was recorded separately by means of a dynamometer and its torque versus shaft revolutions curve was plotted The output mechanical power of the rotor was obtained via some parameters such as wind speed rotational speed Drag coefficient pendulum angle and rotational angle The power of the connected generator which was tested in the wind tunnel has been obtained by measuring the voltages and currents of the load resistors connected to generator Terminal In compared to other vertical wind turbine systems the resulting efficiency of the new concept seems to be lower It could be improved by selecting thinner profiles and using suitable generators as will be seen

Proceedings of the 8th Pacific Rim International Conference on Advanced Materials and Processing (PRICM-8) FernD.S. Marquis, 2017-03-21 PRICM 8 features the most prominent and largest scale interactions in advanced materials and processing in the Pacific Rim region The conference is unique in its intrinsic nature and architecture which crosses many traditional discipline and cultural boundaries This is a comprehensive collection of papers from the 15 symposia presented at this event *Improving Assessments of Hemodynamics and Vascular Disease* Magnus Ziegler, 2019-04-17 Blood vessels are more than simple pipes passively enabling blood to pass through them Their form and function are dynamic changing with both aging and disease This process involves a feedback loop wherein changes to the shape of a blood vessel affect the hemodynamics causing yet more structural adaptation This feedback loop is driven in part by the hemodynamic forces generated by the blood flow and the distribution and strength of these forces appear to play a role in the initiation progression severity and the outcome of vascular diseases Magnetic Resonance Imaging MRI offers a unique platform for investigating both the form and function of the vascular system The form of the vascular system can be examined using MR based angiography to generate detailed geometric analyses or through quantitative techniques for measuring the composition of the vessel wall and atherosclerotic plaques To complement these analyses 4D Flow MRI can be used to quantify the functional aspect of the vascular system by generating a full time resolved three dimensional velocity field that represents the blood flow This thesis aims to develop and evaluate new methods for assessing vascular disease using novel hemodynamic markers generated from 4D Flow MRI and quantitative MRI data towards the larger goal of a more comprehensive non invasive examination oriented towards vascular disease In Paper I we developed and evaluated techniques to quantify flow stasis in abdominal aortic aneurysms to measure this under explored aspect of aneurysmal hemodynamics In Paper II the distribution and intensity of turbulence in the aorta was quantified in both younger and older men to understand how aging changes this aspect of hemodynamics A method to quantify the stresses generated by turbulence that act on the vessel wall was developed and evaluated using simulated flow data in Paper III and in Paper V this method was utilized to examine the wall stresses of the carotid artery The hemodynamics of vascular disease cannot be

uncoupled from the anatomical changes the vessel wall undergoes and therefore Paper IV developed and evaluated a semi automatic method for quantifying several aspects of vessel wall composition These developments taken together help generate more valuable information from imaging data and can be pooled together with other methods to form a more comprehensive non invasive examination for vascular disease
