Concrete in the Service of Mankind Ravindra Dhir, Thomas Dyer, 1996-06-13 Concrete is ubiquitous and unique found in every developed and developing country Indeed there are no alternatives to concrete as a volume construction material for infrastructure This raises important questions of how concrete should be designed and constructed for cost effective use in the the short and long term and to encourage further radical development Equally it must be environmentally friendly during manufacture in an aesthetic presentation in structures and in the containment of harmful materials The central theme of the Congress is Concrete in the Service of Mankind under which five self contained Conferences each dealing with a particular aspect are planned The Congress offers opportunity to discuss how to improve and extend this service to mankind using responsible exploitation underwritten by sound technical understanding and research base It brings together the shared skills and experience of the various disciplines involved in the construction process world wide This major publication continues the tradition established by Dundee University of organizing major international conferences every three years dealing with some aspect of concrete and also the link between Spon and Dundee University for publication of the proceedings This book should be of interest to concrete technologists contractors civil engineers consultants government agencies research organizations Precast-concrete buildings in seismic areas FIB - Féd. Int. du Béton, 2016 This document has a broad scope and is not focussed on design issues Precast construction under seismic conditions is treated as a whole The main principles of seismic design of different structural systems their behavior and their construction techniques are presented through rules construction steps and sequences procedures and details that should lead to precast structures built in seismic areas complying with the fundamental performance requirements of collapse prevention and life safety in major earthquakes and limited damage in more frequent earthquakes The content of this document is largely limited to conventional precast construction and although some information is provided on the well known PRESSS technology jointed ductile dry connections this latter solution is not treated in detail in this document The general overview contained in this document of alternative structural systems and connection solutions available to achieve desired performance levels intends

to provide engineers architects clients and end users in general with a better appreciation of the wide range of applications that modern precast concrete technology can have in various types of construction from industrial to commercial as well as residential Lastly the emphasis on practical aspects from conceptual design to connection detailing aims to help engineers to move away from the habit of blindly following prescriptive codes in their design but instead go back to basic principles in order to achieve a more robust understanding and thus control of the seismic behaviour of the structural system as a whole as well as of its components and individual connections

*View Full-Size Image Corrugated-steel-web bridges* FIB - Féd. Int. du Béton, 2015 To date very little has been published on the topic of corrugated steel web bridges fib Bulletin 77 offers the global engineering community a first complete overview of this fascinating technology The shear capacity of corrugated steel web began to be studied in Japan in 1965 and resulted in the use of corrugated steel in steel girder webs as a replacement for web stiffeners After Japan laid the groundwork for the technology France built the first composite bridge with corrugated steel webs and upper and lower concrete slabs in the 1980s Composite bridges had already been popular in France but engineers found that concrete slab creep meant that prestressing force spread into the steel plates causing high losses Corrugated steel web which reduces axial stiffness was welcomed as a solution to this problem and several bridges were designed and built with this technology Building on France's composite technology Japan began developing corrugated web precast box girder bridges in the 1990s and today has over 140 corrugated web bridges by far the largest number for any country in the world Japanese engineers have come a long way in solving issues such as fatigue and ultimate load behaviour and have made good use of corrugated steel web's advantages for bridge building which include reduced self weight of approximately 15% compared with the weight of an ordinary concrete box girder bridge economy and improved construction processes fib Bulletin 77 Corrugated steel web bridges covers numerous examples of bridges in Japan and France as well as an in depth case study and analysis of a large corrugated steel web bridge in Germany This publication offers designers proprietors contractors and architects alike relevant technical and theoretical information on construction processes along with ideas for future development

*Concrete*, 1999 *Planning and design handbook on precast building structures* FIB - Féd. Int. du Béton, 2014 In 1994 fib Commission 6 Prefabrication edited a successful Planning and Design Handbook that ran to approximately 45 000 copies and was published in Spanish and German Nearly 20 years later Bulletin 74 brings that first publication up to date It offers a synthesis of the latest structural design knowledge about precast building structures against the background of 21st century technological innovations in materials production and construction With it we hope to help architects and engineers achieve a full understanding of precast concrete building structures the possibilities they offer and their specific design philosophy It was principally written for non seismic structures The handbook contains eleven chapters each dealing with a specific aspect of precast building structures The first chapter of the handbook highlights best practice opportunities that will enable architects design engineers and contractors to work together towards finding efficient

solutions which is something unique to precast concrete buildings The second chapter offers basic design recommendations that take into account the possibilities restrictions and advantages of precast concrete along with its detailing manufacture transport erection and serviceability stages Chapter three describes the precast solutions for the most common types of buildings such as offices sports stadiums residential buildings hotels industrial warehouses and car parks Different application possibilities are explored to teach us which types of precast units are commonly used in all those situations Chapter four covers the basic design principles and systems related to stability Precast concrete structures should be designed according to a specific stability concept unlike cast in situ structures Chapter five discusses structural connections Chapters six to nine address the four most commonly used systems or subsystems of precast concrete in buildings namely portal and skeletal structures wall frame structures floor and roof structures and architectural concrete facades In chapter ten the design and detailing of a number of specific construction details in precast elements are discussed for example supports corbels openings and cutouts in the units special features related to the detailing of the reinforcement and so forth Chapter eleven gives guidelines for the fire design of precast concrete structures The handbook concludes with a list of references to good literature on precast concrete construction
