Exterior Ballistics George Klimi, 2014. The noteworthy findings and innovative methods of predicting projectile trajectory introduced in my books *Exterior Ballistics A New Approach EBNA* Xlibris 2010 and *Exterior Ballistics with Applications EBA3e* Xlibris third edition December 2011 require a methodical approach and further development. As a result, the amateurs and professionals interested in exterior ballistics of firearms and especially in long range shooting with small arms have a new book *Exterior Ballistics The Remarkable Methods EBRM* that aims to enrich the foundations of modern exterior ballistics and to lessen the complexity of physics and mathematics techniques in use. *Exterior Ballistics The Remarkable Methods* is a book that combines and develops further the methods introduced in *EBA3e*, *EBNA* and in the *Exterior Ballistics of Small Arms EBSA* Xlibris 2009. The foundations of the book are mainly the findings and the innovative ballistics methods presented in *EBA3e* and *EBNA*. The remarkable methods of exterior ballistics presented in this new book include: The methods of determining the function of resistance $G(v)$ of a given bullet $i = 1$ using range tables or the experimental data measurements of three or four coordinates at the points of projectile impact; The model of Tangent Law of Trajectory Refraction and the related set of formulas that we use to study the trajectories of projectiles in nonstandard atmosphere; Series expansion method and the techniques of second to sixth order parabolas we employ to predict with great accuracy the projectile trajectory; The exceptional Siacci's methods that we apply as well for the projectile trajectory in nonstandard atmosphere and in inclined shooting combined with the tangent law of trajectory refraction. It is important to note that using the similarity laws of fluid dynamics we have obtained the tangent law of projectile refraction which represents a progress with respect to Newton Snell's law on projectile refraction. For better understanding of the information presented in the book, the reader should refer to my three preceding books on exterior ballistics already published by Xlibris, although most of the material is self contained and clear enough to be accessed and assimilated by a wide range of readers. The system of units used in the book is the International System SI. For readers that are unfamiliar with the SI system, it is not difficult to become accustomed and use the materials presented in the book to benefit from the simple illustrations, exercises and PC programs that at the same time give answers to many problems encountered in practice. My studies and writing work in exterior ballistics intend to find new and simple mathematical models and methods to predict the elements of the projectile trajectory. I believe that I have achieved some good results which need to be further developed. George Klimi PhD New York December 2012 gklimi@pace.edu iven24@aol.com

gklimi citytech cuny edu Airborne Wind Energy Roland Schmehl, 2018-03-31 This book provides in depth coverage of the latest research and development activities concerning innovative wind energy technologies intended to replace fossil fuels on an economical basis. A characteristic feature of the various conversion concepts discussed is the use of tethered flying devices to substantially reduce the material consumption per installed unit and to access wind energy at higher altitudes where the wind is more consistent. The introductory chapter describes the emergence and economic dimension of airborne wind energy. Focusing on Fundamentals Modeling Simulation Part I includes six contributions that describe quasi steady as well as dynamic models and simulations of airborne wind energy systems or individual components. Shifting the spotlight to Control Optimization Flight State Measurement Part II combines one chapter on measurement techniques with five chapters on control of kite and ground stations and two chapters on optimization. Part III on Concept Design Analysis includes three chapters that present and analyze novel harvesting concepts as well as two chapters on system component design. Part IV which centers on Implemented Concepts presents five chapters on established system concepts and one chapter about a subsystem for automatic launching and landing of kites. In closing Part V focuses with four chapters on Technology Deployment related to market and financing strategies as well as on regulation and the environment. The book builds on the success of the first volume *Airborne Wind Energy* Springer 2013 and offers a self contained reference guide for researchers scientists professionals and students. The respective chapters were contributed by a broad variety of authors academics practicing engineers and inventors all of whom are experts in their respective fields **Basics of Aerothermodynamics** Ernst Heinrich Hirschel, 2015-01-06 This successful book gives an introduction to the basics of aerothermodynamics as applied in particular to winged re entry vehicles and airbreathing hypersonic cruise and acceleration vehicles. The book gives a review of the issues of transport of momentum energy and mass real gas effects as well as inviscid and viscous flow phenomena. In this second revised edition the chapters with the classical topics of aerothermodynamics more or less were left untouched. The access to some single topics of practical interest was improved. Auxiliary chapters were put into an appendix. The recent successful flights of the X 43A and the X 51A indicate that the dawn of sustained airbreathing hypersonic flight now has arrived. This proves that the original approach of the book to put emphasis on viscous effects and the aerothermodynamics of radiation cooled vehicle surfaces was timely. This second revised edition even more accentuates these topics. A new additional chapter treats examples of viscous thermal surface effects. Partly only very recently obtained experimental and numerical results show the complexity of such phenomena dependence of boundary layer stability skin friction boundary layer thicknesses and separation on the thermal state of the surface and their importance for airbreathing hypersonic flight vehicles but also for any other kind of hypersonic vehicle Biomimetics Bharat Bhushan, 2016-02-19 This revised updated and expanded new edition presents an overview of biomimetics and biologically inspired structured surfaces. It deals with various examples of biomimetics which include surfaces with roughness induced superomniphobicity self

cleaning antifouling and controlled adhesion The focus in the book is on the Lotus Effect Salvinia Effect Rose Petal Effect Oleophobic philic Surfaces Shark Skin Effect and Gecko Adhesion This new edition also contains new chapters on the butterfly wing effect bio and inorganic fouling and structure and Properties of Nacre and structural coloration

Separated and Vortical Flow in Aircraft Wing Aerodynamics Ernst Heinrich Hirschel, Arthur Rizzi, Christian Breitsamter, Werner Staudacher, 2020-10-04 Fluid mechanical aspects of separated and vortical flow in aircraft wing aerodynamics are treated The focus is on two wing classes 1 large aspect ratio wings and 2 small aspect ratio delta type wings Aerodynamic design issues in general are not dealt with Discrete numerical simulation methods play a progressively larger role in aircraft design and development Accordingly in the introduction to the book the different mathematical models are considered which underlie the aerodynamic computation methods panel methods RANS and scale resolving methods Special methods are the Euler methods which as rather inexpensive methods embrace compressibility effects and also permit to describe lifting wing flow The concept of the kinematically active and inactive vorticity content of shear layers gives insight into many flow phenomena but also with the second break of symmetry the first one is due to the Kutta condition an explanation of lifting wing flow fields The prerequisite is an extended definition of separation flow off separation at sharp trailing edges of class 1 wings and at sharp leading edges of class 2 wings The vorticity content concept with a compatibility condition for flow off separation at sharp edges permits to understand the properties of the evolving trailing vortex layer and the resulting pair of trailing vortices of class 1 wings The concept also shows that Euler methods at sharp delta or strake leading edges of class 2 wings can give reliable results Three main topics are treated 1 Basic Principles are considered first boundary layer flow vortex theory the vorticity content of shear layers Euler solutions for lifting wings the Kutta condition in reality and the topology of skin friction and velocity fields 2 Unit Problems treat isolated flow phenomena of the two wing classes Capabilities of panel and Euler methods are investigated One Unit Problem is the flow past the wing of the NASA Common Research Model Other Unit Problems concern the lee side vortex system appearing at the Vortex Flow Experiment 1 and 2 sharp and blunt edged delta configurations at a delta wing with partly round leading edges and also at the Blunt Delta Wing at hypersonic speed 3 Selected Flow Problems of the two wing classes In short sections practical design problems are discussed The treatment of flow past fuselages although desirable was not possible in the frame of this book **Air Transport Provision in Remoter Regions** Svein Bråthen, 2016-03-23 This book stems from a series of biennial conferences devoted to issues affecting air transport provision in remoter regions that have been organized by the Centre for Air Transport in Remoter Regions at Cranfield University The primary aim of the conferences has been to provide an opportunity for those responsible for operating managing regulating and financing air transport services and associated infrastructure in these areas to be informed of the latest best practice initiatives to contrast different policy approaches and to debate potential solutions to perennial problems Remoter regions has been a neglected area of air transport as much of the focus of

public and media attention is on the larger airlines airports and aircraft While the number of large airports in the world is in the hundreds there are many thousands of smaller airports providing communities all over the globe with vital air links More often than not these services and the airports to which they are operated are loss making and require subsidies to sustain them There are therefore many more interested parties involved in both providing and deciding issues relating to the provision of air transport in these situations most especially central regional and local governments who are charged with financing these activities The book contains 17 chapters from experts in remote region air transport within the following 5 sections Key economic and socio economic issues Subvention mechanisms Route development initiatives Infrastructure provision Issues affecting the provision of air services in remoter regions
