Fundamentals of Power Electronics Erickson,2013-06-29 In many university curricula the power electronics field has evolved beyond the status of comprising one or two special topics courses Often there are several courses dealing with the power electronics field covering the topics of converters motor drives and power devices with possibly additional advanced courses in these areas as well There may also be more traditional power area courses in energy conversion machines and power systems In the breadth vs depth tradeoff it no longer makes sense for one textbook to attempt to cover all of these courses indeed each course should ideally employ a dedicated textbook This text is intended for use in introductory power electronics courses on converters taught at the senior or first year graduate level There is sufficient material for a one year course or at a faster pace with some material omitted for two quarters or one semester The first class on converters has been called a way of enticing control and electronics students into the power area via the back door The power electronics field is quite broad and includes fundamentals in the areas of Converter circuits and electronics Control systems Magnetics Power applications Design oriented analysis This wide variety of areas is one of the things which makes the field so interesting and appealing to newcomers This breadth also makes teaching the field a challenging undertaking because one cannot assume that all students enrolled in the class have solid prerequisite knowledge in so many areas **Telecom Power Systems**

Powering Autonomous Sensors María Teresa Penella-López, Manuel Gasulla-Fornier, 2011-05-18 Autonomous sensors

transmit data and power their electronics without using cables They can be found in e g wireless sensor networks WSNs or remote acquisition systems Although primary batteries provide a simple design for powering autonomous sensors they present several limitations such as limited capacity and power density and difficulty in predicting their condition and state of charge An alternative is to extract energy from the ambient energy harvesting However the reduced dimensions of most autonomous sensors lead to a low level of available power from the energy transducer Thus efficient methods and circuits to manage and gather the energy are a must An integral approach for powering autonomous sensors by considering both primary batteries and energy harvesters is presented Two rather different forms of energy harvesting are also dealt with optical or solar and radiofrequency RF Optical energy provides high energy density especially outdoors whereas RF remote powering is possibly the most feasible option for autonomous sensors embedded into the soil or within structures Throughout different chapters devices such as primary and secondary batteries supercapacitors and energy transducers are extensively reviewed Then circuits and methods found in the literature used to efficiently extract and gather the energy are presented Finally new proposals based on the authors own research are analyzed and tested Every chapter is written to be rather independent with each incorporating the relevant literature references Powering Autonomous Sensors is intended for a wide audience working on or interested in the powering of autonomous sensors Researchers and engineers can find a broad introduction to basic topics in this interesting and emerging area as well as further insights on the topics of solar and RF harvesting and of circuits and methods to maximize the power extracted from energy transducers
