## Key Points

The carbon cycle involves the cycling of carbon between the environment and organisms.

Photosynthesis and respiration are the key processes involved in the cycle.

Also decomposition which involves microorganisms called decomposers is important to digest waste and dead organisms. These microorganisms are bacteria and fungi.

These decomposers carry out respiration which converts carbon compounds in dead and waste material back to carbon dioxide in the air.

**Global Climate Change and Response of Carbon Cycle in the Equatorial Pacific and Indian Oceans and Adjacent Landmasses** Hodaka Kawahata, Yoshio A. Awaya, 2006-12-08 To understand the global warming mechanism global mapping of primary production was carried out under the GCMAPS program The program was concerned with marine and terrestrial environmental changes which affect carbon cycle on the regional and global scales On the regional scale warm phase of ENSO El Niño Southern Oscillation has been shown to affect economic activities in many countries The keyword for understanding mechanism of global warming is primary productivity The earth observation satellites EOS like the ADEOS of Japan and the SeaWiFS Sea Star and Terra of the U S A provided much required data for modeling and verification of primary production estimates on both land and ocean The knowledge gained during the GCMAPS program has been documented in this book Interpretation of the data suggests that global warming which causes temperature and sea level rise and changes in climate and ecosystems is likely to have the largest influence on mankind The first half of this book discusses changes in marine environments Physical and chemical oceanographic properties of the equatorial Pacific and Indian Oceans are presented Changes in partial pressure of carbon dioxide flux and composition of settling particles and biological communities in the surface ocean have also been discussed In addition to this over hundred years of environmental records based upon coral skeletons are presented Estimations of primary production and its utilization in validating satellite imagery data were conducted in the western North Pacific Primary productivity estimates based upon the validated satellite imagery are presented on the global scale Climate change modeling of primary production in global oceans is also presented The latter half of this book deals with changes in terrestrial environments Primary productivity estimates for different types of ecosystems e.g. forest grassland are presented together with soil carbon dynamics Also biomass and productivity estimation and environmental monitoring based upon remote sensing techniques are presented with a model analysis of the relationship between climate perturbations and carbon budget anomalies in global terrestrial ecosystems This book elucidates integrated aspects of the global carbon cycle involving marine and terrestrial environments Discusses a current understanding of the biogeochemical processes on land and ocean Provides global mapping of primary production based on satellite imagery data and modelling Presents the latest interpretations of relationships between carbon cycle and climatic change
